Having an undulating character; moving in the manner of waves; resembling the motion of waves, which successively rise or swell and fall; pertaining to such a motion; as, the undulatory motion of water, of air, or other fluid.—*Undulatory theory*, in optics, the theory which regards light as a mode of motion generated by molecular vibrations in the luminous source, and propagated by undulations in a subtle medium (ether), sensibly imponderable, presumed to pervade all space, including the intervals which separate the molecules or atoms of ponderable bodies. When these undulations reach and act on the nerves of our retina, they produce in us the sensation of light. The only other theory of light which can be opposed to this, and which is variously called the corpuscular, emission, or material theory, supposes light to consist of material particles, emitted from the source, and projected in straight lines in all directions with a velocity which continues uniform at all distances, and is the same for all intensities. It would seem that every phenomenon which can be brought under the corpuscular theory can with equal facility be explained by the undulatory theory; while there are some known effects, as the phenomena of reflection and refraction, in strict accordance with the principles of the latter, which cannot, without great difficulty and the introduction of gratuitous suppositions, be accounted for by the corpuscular theory. The undulatory theory is therefore now generally adopted by physicists.

Union Flag of Britain.

The national flag of England was the banner of St. George (heraldically described as argent, a cross gules), and soon after the union of the crowns this was united with the Scottish national flag or banner of St. Andrew (in the language of heraldry azure, a saltire argent), thus forming the first union flag. On the legislative union with Scotland in 1707 a new design for the national or union flag was adopted, described in heraldic terms as azure, a saltire argent surmounted by a cross gules fimbriated or edged of the second. On the union with Ireland the red cross or saltire of St. Patrick was introduced, and as thus modified the flag now exists. The union flag, when used by itself or as an independent flag, is the national banner always used on shore. When it occupies the upper corner or canton next the staff of a red, white, or blue field, the flag so formed is called the red, white, or blue ensign, and in this form it is only used on board ship. (See JACK.) The union of the United States is a blue field with white stars, the stars denoting the union of the States and properly being equal in number to the states. The name seems also to be given to a corresponding portion of any flag.—6. In *math.* and *physics*, any known determinate quantity by the constant repetition of which any other quantity of the same kind is measured; that magnitude which is to be considered or reckoned as one when other magnitudes of the same kind are to be measured. The system of units recommended by a committee of the British Association for scientific calculations, and known as the *C. G. S. system*, adopts the *centimetre* as the unit of length, the *gramme* as the unit of mass, and the *second* as the unit of time, these words being represented respectively by the above letters. In this system the *unit of area* is the square centimetre, the *unit of volume* is the cubic centimetre, and the *unit of velocity* is a velocity of a centimetre per second. The *unit of momentum* is the momentum of a gramme moving with a velocity of a centimetre per second. The *unit-force* is that force which acting on a gramme for one second generates a velocity of a centimetre per second. This force is called a *dyne* (which see). One who ascribes divinity to God the Father only; specifically, one of a religious sect or congregations of sects, distinguished by the denial of the received doctrine of the Trinity. The Unitarians may be divided into two classes: (1) The conservative or orthodox Unitarians, who accept the general articles of the Christian creed (with the exception of the Trinity), such as miracles, the resurrection of Christ, and the plenary inspiration of Scripture. (2) The liberal or progressive Unitarians, whose creed is purely rationalistic. They consider Christ as a mere man, inspired as other great men are, though in a greater degree; they reject the doctrines of original sin, eternal punishments, the belief in miracles, and generally the whole supernatural element in Christianity. They deny the necessity of an atonement, considering Christ's death but as a martyrdom in defence of truth. This latter class forms the majority of the body in numbers, in intellect, and in position.—2. A monotheist; a believer in one God, as opposed to a polytheist, or a believer in many gods. 3. In *math.* the abstract expression for any unit whatsoever; any definite quantity or aggregate of quantities or magnitudes taken as one, or for which 1 is made to stand in calculation. The terms *unit* and *unity* are often used synonymously, but in general the number 1 is *unity* when it is not applied to any particular object, and a *unit* when it is so applied. See UNIT, 3.—4. The principle by which a uniform tenor of story and propriety of representation is preserved in literary compositions; conformity in a composition to these principles; a reference to some one purpose or leading idea in all the parts of a discourse or composition. The so-called Aristotelian law of *unity of time, of place, and of action* in a drama was the fundamental rule or general idea from which the French classical dramatic writers and critics derived, or to which they referred, all their practical rules for the construction of a drama. This law demanded that there should be no shifting of the scene from place to place, that the whole series of events should be such as might occur within the space of a single day, and that nothing should be admitted irrelevant to the development of the single plot.—5. In *music* and the *fine arts*, such a combination of parts as to constitute a whole or a kind of symmetry of style and character; the quality of any work by which all the parts are subordinate to or promotive of one general design or effect.—6. The univalves formed one of the three divisions into which shells were divided by Linnaeus, the other two divisions being bivalves and multivalves; but this is not a scientific classification, and has long been given up, the term being now used only as a convenient description of certain of the mollusca. The univalves include most of

the Gasteropoda, as land-snails, sea-snails, whelks, limpets, &c. The majority of univalve shells are cone-shaped and spiral. In the simplest form the conical shape is retained without any alteration, as in the limpet. In most cases, however, the cone is elongated, sometimes forming a simple tube, as in Dentalium, but usually coiled up into a spiral. Sometimes, as in Vermetus, the coils or 'whorls' of the shell are hardly in contact, but most commonly they are so amalgamated that the inner side of each convolution is formed by the pre-existing whorl. In some cases, as in the common fresh-water Planorbis, the whorls are coiled round a central axis in the same plane, and the shell is said to be *discoidal*. In most cases, however, the whorls are wound round an axis obliquely, a true spiral being formed, and the shell becoming *turreted, trochoid, turbinated, &c.*

The peculiarities of this instrument are that

the telescope, instead of being a straight tube, is broken into two arms at right angles to each other in the middle of the length of the tube, and at the break a totally reflecting prism is placed, which turns the rays entering the object-glass in a rectangular direction along the eye-end of the telescope which forms part of the horizontal axis of the circle, so that the telescope becomes free to move through all altitudes. — *Universal joint*. See **JOINT**. — *Universal legatee*, in *Scots law*, a legatee to whom the whole estate of a deceased party is given, subject only to the burden of other legacies and debts. — *Universal lever*. 2. In *philos.* a general notion or idea; that which by its nature is fit to be predicated of many; that which by its nature has a fitness or capacity to be in many. Universals have been divided into *metaphysical*, or those archetypal forms existing in the divine mind and forming the patterns after which all things were created; *physical*, or certain common natures diffused over or shared in by many, as *rationality* by all men; and *logical*, or general notions framed by the human intellect, and predicated of many things, on the ground of their possessing common properties, as *animal*, which may be predicated of man, lion, horse, &c. In *anc. philos.* the universals were called *predicables*, and were arranged in five classes, *genus, species, differentia, proprium, and accidentis*.

The same colour being observed to-day in chalk or snow which the mind yesterday received from milk, it considers that appearance alone makes it a representative of all of that kind, and having given it the name of whiteness, it by that sound signifies the same quality wheresoever to be imagined or met with, and thus universals, whether ideas or terms, are made. *Locke*.

3. In *logic*, a universal proposition. See under **ADJECTIVE**.

The name *Universalist* is sometimes applied to the Arminians in consequence of the *universality* which they ascribe to the operation of divine grace and their opposition to the doctrine of *particular* election. — 2. † One who affects to understand all statements or propositions.

A modern freethinker is a *universalist* in speculation; any proposition whatsoever he is ready to decide; self-assurance supplies all want of abilities. *Bentley*.

**Universe** (ū'ni-vēr's), *n.* [Fr. *univers*, from *L. universum*, the universe, neut. of the adj. *universus*, all together, all taken collectively, the whole. See **UNIVERSAL**.] The general system of things; all created things viewed as constituting one system or whole; the whole creation; the world; the *pan* of the Greeks and the *mundus* of the Latins.

For nothing this wide universe I call, Save thou, my rose; in it thou art my all. *Shak.*

— *World, Universe, Creation*. *World* properly signifies this globe and everything inhabiting it, as animals and vegetables, or immediately associated with it, as the atmosphere, &c. *Universe* designates the entire mass of worlds, with everything associated with them, comprehending all stars, planets, satellites, comets, &c., regarded as one system. *Creation*, in its most extended sense, is nearly synonymous with *universe*, differing from it principally in not comprehending the Great First Cause and the idea of space. It is often used in a sense limited by the epithet or qualifying word preceding it; as, the *brute creation*, the *rational creation*.

**University** (ū-ni-vēr's'i-ti), *n.* [L. *universitas*, the whole of anything as contrasted with its parts, the universe; later, an association, corporation, company, &c.] 1. † The whole; the universe. 'Speaking with respect to the *universality* of things.' *Barrow*. — 2. † A corporation; a guild. — 3. In the modern sense of the term, an establishment or corporation for the purposes of instruction in all or some of the most important branches of science and literature, and having the power of conferring certain honorary dignities, termed *degrees*, in several faculties, as arts, medicine, law, and theology. In most cases the corporations constituting universities include a body of teachers or professors for giving instruction to students; but this is not essential to a university, the staff of London University being merely an examining body. In the middle ages, when the term began to be used in reference to seminaries of learning, it denoted either the whole body of teachers and learners, or the whole body of learners, with corporate rights and under by-laws of their own, divided either by faculty or by country (hence the 'nations' into which the students were classed), or both together, its meaning being determined by the words with which it was connected. At a later period the expression *universitas literarum* (the whole of literature or learning) was used to indicate that all the most important branches of knowledge were to be taught in these establishments; and it would seem that the twofold application of *universitas* led to the distinctive meaning of the term as now used. Some, forming their notion of the word *university* merely from the English universities, suppose that it necessarily means a collection and union of colleges, that it is a great corporation embodying in one the smaller and subordinate collegiate bodies; but this is not correct, for many universities exist in which there are no colleges. This is the case with most of the German universities, and in the Scottish universities there are no foundations which bear any resemblance to the English colleges. Besides, the universities of Oxford and Cambridge existed before a single college was endowed. The oldest of the European universities were those of Bologna and Paris, and these formed the models on which the other universities which subsequently sprung up in various parts of Europe were established.

**Uranium** (ū-rā'nī-um), *n.* Sym. U. At. wt. 240; sp. gr. 18.4. A rare metal, whose oxide Klaproth, in 1789, discovered in pitchblende or pechblende and uranite. Peligrot first isolated uranium in a pure form in 1840, and determined its atomic weight, at the same time showing that Klaproth's uranium was a protoxide (UO). It was not obtained compact till 1856. The chief source of uranium is pitchblende, which contains nearly 80 per cent of the black oxide and uranite. Metallic uranium is obtained by decomposing its protochloride with potassium or sodium, first in the form of a black powder, or sometimes aggregated on the sides of a crucible in small plates, having a silvery lustre and a certain degree of malleability. By subjecting the metal in either of these forms to further processes it is ultimately obtained in fused globules. In its compact state uranium is somewhat malleable and hard, but is scratched by steel. Its colour is like that of nickel or iron. When exposed to the air it soon tarnishes and assumes a yellow colour. Uranium forms several oxides, which are used in painting on porcelain, yielding a fine orange colour in the enamelling fire, and a black colour in that in which the porcelain itself is baked.

In *astron.* one of the primary

planets, discovered by Sir William Herschel in 1781. It was first called *Georgium Sidus* in honour of George III., afterwards called *Herschel*, in honour of the discoverer. It is the seventh planet in order of distance from the sun. It presents the appearance of a small round uniformly illuminated disc, without rings, belts, or discernible spots. To the naked eye it appears like a star of the sixth magnitude. Its mean distance from the sun is about 1754 millions of miles, and the length of the year 30686.82 days, or about 84 of our years. Its mean diameter is estimated at about 33,000 miles. Its volume exceeds the earth's about 74 times, but as its mean density is only 0.17 (the earth's being 1) its mass is only about 12½ times more. The length of its day is supposed to be between 9 and 10 hours. There is still some uncertainty as to the number of satellites belonging to Uranus. Herschel records six, and two of the four which are seen by astronomers at the present time cannot be identified with any of these. The satellites of Uranus differ from the other planets, primary and secondary (with the exception of Neptune's satellite), in the direction of their motion, which is from east to west, and they move in planes nearly perpendicular to the ecliptic.

It is soluble both in water and alcohol, and, when heated, it melts, gives off much ammonia, and finally solidifies, being in a great measure converted into ammonia and cyanuric acid. Urea is interesting as being the first substance of animal or vegetable origin which chemists succeeded in preparing by artificial means from inorganic constituents.

It occurs in small quantity in the healthy urine of man and quadrupeds, and in much larger quantity in the urine of birds. The semi-fluid excretions of birds and serpents is principally composed of uric acid and urate of ammonia; and guano, which is the decomposed excrement of aquatic birds, is mainly impure uric acid in a remarkable state of decomposition. Uric acid constitutes the principal proportion of the urinary calculi and the concretions causing the complaint known as the gravel. It crystallizes in fine scales of a brilliant white colour and silky lustre; it is inodorous and insipid, heavier than water, and nearly insoluble in it when cold, and only slightly dissolved by it when hot; the solution reddens litmus paper, but feebly. When it is dissolved in nitric acid, and the solution is evaporated and treated with ammonia, a fine purple colour is produced; by this reaction uric acid may be detected.

In its natural state it is acid, transparent, of a pale amber or straw colour, a brackish taste, a peculiar odour, and of a specific gravity varying from 1.012 to 1.030. The character of the urine, however, is apt to be altered by a variety of circumstances, and from the variety of the substances extracted from the body through the medium of the kidneys the urinary system may be regarded as the enunciator of the entire animal economy, in which we meet with every principle and constituent that analysis has discovered forming the solids and fluids of the body. A knowledge of the urine in health, and of the variations to which it is subject in disease, is of the utmost importance to the medical practitioner, as the different appearances of this fluid indicate not merely the state of the urinary system, but the changes which have taken place in other parts of the animal economy. It varies even in its healthy state according to age, drink, food, medicines, the time of the year, the muscular motion of the body, and the affections of the mind.

**Utilitarian** (ú-til'i-tá'ri-an), *a.* [From *utility*.] Consisting in or pertaining to utility; pertaining to utilitarianism. See extract.

It was in the winter of 1822-23 that I formed the plan of a little society, to be composed of young men agreeing in fundamental principles—acknowledging *Utility* as their standard in ethics and politics, and a certain number of the principal axioms drawn from it in the philosophy (Benthamism) I had accepted—and meeting once a fortnight to read essays and discuss questions conformably to the premises thus agreed on. The fact would hardly be worth mentioning, but for the circumstance that the name I gave to the society I had planned was the *Utilitarian* Society. It was the first time that any one had taken the title of *utilitarian*; and the term made its way into the language from this humble source. I did not invent the word, but found it in one of Galt's Novels, *The Annals of the Parish*, in which the Scotch clergyman, of whom the book is a supposed autobiography, is represented as warning his parishioners not to leave the gospel and become *utilitarians*. With a boy's fondness for a name and a banner I seized on the word, and for some years called myself and others by it as a sectarian appellation; and it came to be occasionally used by some others holding the opinions which it was intended to designate. *J. S. Mill.*

**Utilitarian** (ú-til'i-tá'ri-an), *n.* One who holds the doctrine of utilitarianism.

The *utilitarians* are for merging all the particular virtues into one, and would substitute in their place the greatest usefulness, as the alone principle to which every question respecting the morality of actions should be referred. *Dr. Chalmers.*

S. Mill.*

## V.

**V**, the twenty-second letter of the English alphabet, representing a labial or labiodental consonant sound, produced by the junction of the upper teeth with the lower lip, as in pronouncing *av, ev, ov, vadu*. Its sound (which never varies) is accompanied by the same position of the organs as that required for *f*, but *v* is uttered with voice, and is therefore called sonant, while *f* is surd, or uttered with breath merely. Both *v* and *f* are also continuous consonants, their sound being not checked at once (as in the case of *p, t, &c.*), and they also belong to the class of the spirants. As mentioned under *U*, *v* and *u* were formerly the same letter, but they have now as distinct uses as any two letters in the alphabet. The Roman letter *v* consonant was probably pronounced as *u*: thus *ver*, spring, would be pronounced *uer*; *vespa*, a wasp, *vespa*. This letter did not belong to the Anglo-Saxon alphabet, and its sound is believed to have been represented by *f*, but appears to have occurred only between two vowels (as in *heofon*, heaven). At the beginning of words *f* regularly kept its own sound, and this explains how at the present day scarcely any of the English words that begin with *v* are Teutonic (*vat, vane*, and *vizen* are exceptions), though *v* is common enough in the body of words, as in *have, leave, live, heaven, &c.* Almost all English words with initial *v*, therefore, are of Romance origin, the letter having entered our alphabet from the French. The giving of the *v* sound to *f* also illustrates the change of consonant in the plural of such words as *thief, thieves, wolf, wolves, life, lives*. In the dialect of Southern England *v* commonly takes the place of *f*. In spelling this letter is never final (though its sound often is), nor is it ever doubled. See also *U*.—As a numeral, *V* stands for 5.—In *music*, *V. S.* stands for *volta subito*, turn over (the leaf) quickly.—In *her. V.* is used to express *vert* or *green*, in the tricking or drawing of arms with a pen and ink.

**Vaccination** (vak-si-nā'shon), *n.* The act of vaccinating; the art or practice of inoculating persons with the cow-pox, either directly or indirectly, for the purpose of securing them from the contagion of small-pox. The indirect method of vaccination by lymph taken from a pustule caused by previous vaccination in a healthy child is the most common. Dr. Jenner was the first who showed the beneficial effects of vaccination, which, in a great proportion of instances, confers a complete security against small-pox. Even in those cases where the small-pox does occur after vaccination it is generally divested of its more formidable characters. Repeated vaccinations, with intervals of several years, are believed to increase the security. In

England the vaccination of all children, excepting those in an unhealthy or otherwise unfit condition, is compulsory within three months after birth; in Scotland the time extends to six months. See **COW-POX**, also **INOCULATION**.

The species are natives of North America, where they are abundant; in Europe they occur sparingly, but they are not uncommon in mountainous districts. The properties of the order closely resemble those of Ericaceæ, with which, indeed, Vacciniaceæ have much in common, being mainly distinguished by the inferior ovary and epigynous stamens. The bark and leaves of many of the species are astringent, slightly tonic, and stimulating. The berries of many are eaten under the names of cranberry, whortleberry, &c. Several species are elegant garden shrubs, as those belonging to the genus *Gaylussacia*. The typical genus is *Vaccinium*.

common names of bilberries, whortleberries, cranberries, &c. The following are natives of Britain: *V. Myrtillus*, the common bilberry or blueberry; *V. uliginosum*, great bilberry or bog whortleberry; *V. Vitisidæa*, red whortleberry or cowberry; *V. Oxyccocos*, marsh whortleberry or cranberry; the berries of which made into tarts are much esteemed. **Vacuum** (vak'ü-um), *n.* pl. **Vacuums** (vak'ü-umz), or sometimes **Vacua** (vak'ü-a). [L., an empty space, a void or vacuity, neut. sing. of *vacuus*, empty; *akin vacant, vacation*, &c.] Space empty, or space devoid of all matter or body. Whether there is such a thing as an absolute vacuum in nature is a question which has been much controverted. The existence of a vacuum was maintained by the Pythagoreans, Epi-

cureans, and Atomists, but it was denied by the Peripatetics, who asserted that 'nature abhors a vacuum.' The modern theory, which seems to be warranted by experience, is that an absolute vacuum cannot exist, the subtle medium known as ether being believed to be everywhere present. In a less strict sense a vacuum (more or less perfect) is said to be produced when air is more or less completely removed from an inclosed space, such as the receiver of an air-pump, a portion of a barometric tube, &c. In the receiver of the air-pump the vacuum can only be partial, as the exhaustion is limited by the remaining air not having sufficient elasticity to raise the valves. The Torricellian vacuum, that is, the space above the mercury in a carefully manipulated barometer tube, is more nearly perfect in this respect, but the space is to some extent filled with the vapour of mercury. If, however, an air-pump receiver, filled with pure carbonic acid gas (so as to expel the air), be exhausted, a small vessel containing moist caustic potash, and another containing concentrated sulphuric acid, having been previously introduced, the remaining carbonic acid is taken up and a vacuum produced so nearly absolute that the electric spark fails to pass through it.

H. Knight.*

**Vacuum-pan** (vak'ü-um-pan), *n.* A vessel for boiling saccharine juices in a partial vacuum during the process of sugar-making. It is usually spheroidal in shape, and is made in two segmental or semi-globular portions. The vapour from the boiling juice rises into the dome at the top, when it is removed by a pump or condenser. The advantages of this vessel over the old pans are that the quality and quantity of the crystallizable sugar are raised, a smaller proportion of grape-sugar or molasses being produced. *E. H. Knight.*

**Vacuum-pump** (vak'ü-um-pump), *n.* A pump connected with the boiler of a marine steam-engine for pumping out the air and so creating a vacuum, whereupon the sea-water flows in from the pressure of the atmosphere.

**Vacuum-tube** (vak'ü-um-tüb), *n.* A tube employed to examine the effects of a discharge of electricity through air or gas rarefied or exhausted to the required degree. The most striking phenomenon is the magnificent coloured light with which the tube is filled, the colour of the light being different at the positive and negative electrodes, and varying with the gas through which the discharge is passed. Thus, in common air it is purple or red at the positive end, blue or violet at the negative; in hydrogen, it is greenish-blue; in carbonic oxide, bright green, turning to yellow at the positive, and to blue at the negative.

Hence, perhaps, arose the custom of young men and women choosing each other as valentines by a kind of lottery, and of sending special love missives on this day.— 2. It is used in medicine in the form of infusion, decoction, or tincture, as a nervous stimulant and antispasmodic. Besides valerian oil the root contains starch, extractive matter, resin, and valeric acid. *V. rubra*, or red valerian, is occasionally found wild in Britain, and is cultivated in gardens as well as many other species on account of its elegant flowers. *V. The former may be defined the power or capacity of an article to satisfy our wants or gratify our desires, while the *value in exchange*, or exchange value of a thing, is its general power of purchasing; the command which its possession gives over purchasable commodities in general. Some valves are self-acting, that is, they are so contrived as to open in the required direction by the pressure of the fluid upon their surface, and immediately to shut and prevent the return of the fluid when the direction of its pressure changes. Others are actuated by independent external agency. Examples of the former kind are presented in the valves of pumps, and in the safety-valves of steam boilers, and of the latter in the slide-valves appended to the cylinder of a steam-engine for the purpose of regulating the admission and escape of the steam. The construction of valves admits of an almost endless variety, and the names given to the different classes are derived from peculiar shape, application, mode of actuation, function, &c. See CUP-VALVE, SLACK-VALVE, CONICAL VALVE, D-VALVE, CLACK-VALVE, THROTTLE-VALVE.

metal discovered by Selström in 1830 in iron prepared from the iron ore of Taberg in Sweden. It was afterwards obtained by the same individual in the slag formed during the conversion of the cast-iron of Taberg into malleable iron. It has since been found in a lead ore from Wanlockhead in Scotland, and in a similar mineral from Zimapan in Mexico, and in the sandstone of Alderley Edge, and Mottram St. Andrew, Cheshire. The metal was first obtained by Roscoe, who showed that the substance generally regarded as vanadium was really an oxide. Vanadium has a strong metallic lustre, considerably resembling silver, but still more like molybdenum. When in mass it is not oxidized either by air or water, but the finely powdered metal quickly takes up oxygen from the air. Oxygen and vanadium combine to form five oxides—viz. a monoxide (V<sub>2</sub>O), a dioxide (V<sub>2</sub>O<sub>2</sub>), a trioxide (V<sub>2</sub>O<sub>3</sub>), a tetroxide (V<sub>2</sub>O<sub>4</sub>), and a pentoxide (V<sub>2</sub>O<sub>5</sub>).

**Vapour** (*vā'por*), *n.* [L. *vapor*, steam, vapour; from same root as *vapidus*, vapid, having lost flavour, *vappa*, wine that has become vapid; comp. Goth. *afhvapan*, to be suffocated.] 1. In *physics*, a term applied to designate the gaseous form which a solid or liquid substance assumes when heated. Vapour is, therefore, essentially a gas, and seeing that all known gases have now been proved to be liquefiable, no physical difference can be said really to exist between an ordinary gas, such as oxygen, and a vapour, such as steam. In common language, however, a difference is usually recognized: a *gas* is a substance which at ordinary temperatures and pressures exists in a state of vapour; while a *vapour* is produced by the application of heat to a substance which normally exists in a solid or liquid form. The difference has been otherwise explained to be one not so much of kind as of degree; steam in the boiler of a steam-engine being said to be in a state of vapour, while superheated steam is said to be a gas. Aqueous vapour formed on the surface of the land and water

is always present in suspension in the atmosphere, and when it meets with a reduction of temperature it condenses into water in the form of rain or dew. See EVAPORATION. 2. In a more general and popular sense, any visible diffused substance floating in the atmosphere and impairing its transparency, as fog or mist; lazy matter.

In *gram.* change of termination of words, as in declension, conjugation, comparison, and the like; inflection. *Watts*.—4. The act of deviating; deviation; as, a variation of a transcript from the original.—5. In *astron.* any deviation from the mean orbit or mean motion of a heavenly body, occasioned by another disturbing body. When these deviations are compensated in comparatively short periods of time they are called *periodic variations*, but when the compensation requires an immense period of time for its consummation the variation is called a *secular variation*.—*Variation of the moon*, an inequality in the moon's rate of

motion, occasioned by the attraction of the sun, and depending as to its degree on the moon's position in her orbit.—6. In *physics* and *navigation*, the deviation of the magnetic needle, or needle of the mariner's compass, from the true north point; or the angle which the needle makes with the plane of the meridian of a ship or station; called also *Declination*. The variation of the compass does not remain constantly the same in the same place, but undergoes a slow and progressive change. The needle is observed to move gradually towards the west of the true meridian until it arrives at its maximum on that side; it then returns, passes over the true meridian, and moves easterly, until it arrives at its maximum towards the east, when it returns as before. In the year 1576, in London, the variation was 11° 15' east; in 1652, the needle pointed due north, after which time it travelled about 23° to the westward (the maximum being in 1315); it is now considerably less and is continually decreasing. The variation, however, is very different in different parts of the globe, and it is also subject to diurnal changes in the same place.—7. In *music*, one of a series of ornamental changes or embellishments in the treatment of a tune, movement, or theme during several successive repetitions. The simplest kind of variation is by introducing into the melody a greater or less number of passing notes (that is, notes intermediate in pitch between the original notes of the air), together with cadenzas, scale movements, and the like, or by breaking of the chords into triplets, quadruplets, &c., or throwing them into arpeggio form, the fundamental harmony usually remaining unchanged. In more elaborate styles, however, new harmonies, rhythms, and melodic developments gradually appear, often brilliantly displaying the fertility of the composer's fancy. In many cases variations are mere unmeaning ornaments designed to exhibit the mechanical dexterity of the performer.—*Calculus of variations*, a branch of analysis, the chief object of which is to find what function of a variable will be a maximum or minimum on certain prescribed conditions. This calculus offers the only general, and frequently the only possible, means of solving those problems generally termed isoperimetrical.—*SYN.* Change, modification, vicissitude, mutation, deviation.

Specifically, in scientific classifications, a subdivision of a species of animals or plants; an individual or group of individuals differing from the rest of the species to which it belongs in some accidental circumstances which are not essential to the species. Varieties are considered as less permanent than species, and those naturalists who look upon species as strictly distinct in their origin, consider varieties as modifications of them arising from particular causes, as climate, nourishment, cultivation, and the like. See the following quotation.

No one definition (of species) has satisfied all naturalists; yet every naturalist knows vaguely what he means when he speaks of a species. . . . The term *variety* is almost equally difficult to define; but here commonness of descent is almost universally implied, though it can rarely be proved. . . . Practically when a naturalist can unite by means of intermediate links any two forms, he treats the one as a *variety* of the other, ranking the most common, but sometimes the one first described, as the species, and the other as the *variety*. But cases of great difficulty. . . . sometimes arise in deciding whether or not to rank one form as a *variety* of another even when they are closely connected by intermediate links. . . . Few well-marked and well-known *varieties* can be named which have not been ranked as species by at least some competent judges. *Darwin.*

In like manner the term *variety* is applied to inorganic substances of the same kind, which are susceptible of classification, to note differences in colour, structure, crystallization, and the like, all the varieties being referable to some one species which is assumed as the typically perfect standard; as, *varieties* of quartz, diamond, and the like.

The general name for the body of ancient Sanskrit hymns, with accompanying comments, believed by the Hindus to have been revealed by Brahma, and on which the Brahmanic system is based. The hymns, which are upwards of 1000, fall into four divisions (*Vedas* or *Sanhitas*), called respectively *Rig-Veda*, *Yajur-Veda*, *Sama-Veda*, and *Atharva-Veda*, of which the first (see *RIG-VEDA*) is the oldest and the *Atharva-Veda* the latest.

Each of these Vedas or *Sanhitas* consists of two parts—the *Sanhita* proper, or a collection of *Mantras* or hymns, consisting of invocations, adoration, thanksgiving, praise, prayer, and the like, and of *Brahmanas*, or commentaries, which have grown round the *Sanhita*, consisting of explanations, mystical and philosophical speculations, legends and illustrations, injunctions in regard to rites and sacrifices, and the like. Varying greatly in age, the Vedas represent many stages of thought and worship, the earliest being the simplest, and the later following and reflecting the development of the Brahmanical system with all its superstitions and rites. Even the most ancient Vedas exhibit a people in an advanced state of civilization.

The Vedas had their origin in the wonder with which early man regarded the universe and the operations going on in it. They consist, therefore, largely of highly figurative addresses to the great powers of nature under seemingly individual names, as *Indra* (the Firmament), *Agni* (Fire), *Mitra* (Sunrise), *Varuna* (the Sea), and the like, behind whom, however, a great Being (*Om*) is dimly recognized. Gradually these powers became more and more endowed with personality, and ultimately came to be regarded as real divinities, to whose number more and more were gradually added.

G. *veine, feme, fem*, punishment, and *gericht*, a court of justice.] A system of secret tribunals which originated during the middle ages in Westphalia, and then spread over Germany when the regular administration of justice had fallen into complete disorder. The chief of the association (the *Freigraf*=free count) was usually a man of exalted rank, and had the supreme direction of the courts. His associates (*Frei-schöffen*=free justices) concurred in and executed the sentences of the court, being bound by a tremendous oath to obey all its behests, and keep secret its proceedings from all that is between heaven and earth. The assemblies of the tribunal were sometimes held in public and in the open air, but were generally held by night in a forest or in some other concealed place. Any person supposed to be guilty of heresy, sorcery, rape, theft, robbery, or murder, might be summoned before the court and compelled to answer to the charge brought against him by the accuser, who was one of the *Frei-schöffen*. If the accused was found guilty of a capital crime, or if he repeatedly refused to appear on being duly cited, it was the duty of the *Frei-schöffen* to put him to death. This system offered great scope for the spirit of private revenge, malice, and interested motives, and many judicial murders were perpetrated. When the governments of the various states became more effective and society more settled, the regular executive struggled to destroy the power of the *vehmgerichte*, and ultimately succeeded, the last tribunal being held at Zell in 1568.

One of a system of membranous canals or tubes distributed throughout the bodies of animals for the purpose of returning the impure blood from the extremities, surfaces, and viscera to the heart and lungs. They are devoid of elasticity, and have no pulsation, the motion of the blood being mainly secured by pressure of the moving muscles, between which they are imbedded, the backward flow of the blood being prevented where necessary by a series of valves which permit a current only towards the heart. The veins arise from venous capillaries which collect from the tissues the blood recently brought to them by the arterial capillaries. These venous capillaries unite to form ultimate veins, which still unite in turn, forming gradually larger branches and trunks as they approach the centre of the circulation. The venous blood returned from above the region of the heart is united in one great vein, the *vena cava superior*, all those from below entering by the *vena cava inferior*. The portal vein (*vena porta*) receives the venous blood from the intestines and conveys it through the liver to the *vena cava inferior*. The pulmonary vein and branches go from the right side of the heart to the lungs, carrying the blood to the air-sacs to be revived by the oxygen of the inspired air. The veins like the arteries are composed of three coats. Valves are absent in the *vena porta*, the portal, the pulmonary, and various other veins, and are present in greatest numbers in the veins of the extremities.—2. A tube or an assemblage of tubes through which the sap of plants is transmitted along the leaves. The term is more appropriately applied to the finer and more complex ramifications which interbranch with each other like net-work, the larger and more direct assemblages of vessels being called *ribs* and *nerves*. Veins are also found in the calyx and corolla of flowers.—3. A crack or fissure in a rock, filled up by substances different from the rock, and which may either be metallic or non-metallic. Veins are sometimes many yards wide, having a length of many miles, and they ramify or branch out into innumerable smaller parts, often as slender as threads. Metallic veins are chiefly found in the primary, and lower and middle secondary rocks. Many species of stones, as granite, porphyry, &c., are often found in veins.—4. A streak or wave of different colour, appearing in wood, in marble, and other stones; a long irregular streak of colour.—5. A cavity, fissure, or cleft, as in the earth or other substance. One of the older forms of this carriage consisted of two wheels of nearly equal size, placed one before the other, and connected by a beam on which the driver's seat was fixed. The rider, sitting astride the machine, propelled it by the thrust of each foot on the ground. This form dates from the early part of the present century. About half a century later treadles operating cranks on the axle of the front wheel came into use, and soon many modified and improved kinds became popular under the name of the bicycle. (See **BICYCLE**.) A three-wheeled velocipede, or tricycle, which offers a safer seat to its occupant, is also in extensive use, and may be so constructed as to carry two persons. It is not applied to the movements of animals, or but rarely. See **CELERITY**.—2. In *physics*, rate of motion, whether fast or slow; the rate at which a body changes its position in space; the rate of change of position of a point per unit of time. The *velocity* of a body is *uniform* when it passes

through equal spaces in equal times, and it is *variable* when the spaces passed through in equal times are unequal. The *velocity* of a body is *accelerated* when it passes through a greater space in equal successive portions of time, as is the case of falling bodies under the action of gravity, and it is *retarded* when a less space is passed through in each successive portion of time. When the motion of a body is uniform its *velocity* is measured by the space described by it in a unit of time, as one second. If the motion of the body is not uniform its *velocity* is measured by the space which it would describe uniformly in a given time, if the motion became and continued uniform from that instant of time. The unit of space and time taken in order to measure *velocity*, may be assumed of any magnitude, but in theoretical mechanics one second is usually taken as the unit of time, and one foot as the unit of space.—*Angular velocity*. See under **ANGULAR**.—*Initial velocity*, the rate of movement of a body at starting; especially used of the *velocity* of a projectile as it issues from a firearm.—*Virtual velocity*. See under **VIRTUAL**.—**SYN.** Swiftness, rapidity, celerity, speed, fleetness, quickness.

This vein receives the blood from the extremities and other parts, and transmits it to the right auricle of the heart. It is divided into the *superior* and *inferior*. (See **HEART**.) *Vena porta*, the great vein situated at the entrance of the liver. It receives the blood from the abdominal viscera, and carries it into the substance of the liver, where the blood is utilized in the formation of bile. 'And shakes corruption on her *venal* throne.' *Thomson.*  
*Venal* and licentious scribblers, with just sufficient talents to clothe the thoughts of a pandar in the style of a belman, were now the favourite writers of the sovereign and the public. *Macaulay.*  
—**Venal**, **Mercenary**, **Hireling**. Although both *venal* and *mercenary* are used in a bad sense, *venal* is much stronger than *mercenary*, standing to it in the relation of sale to hire. A *venal* man sells himself wholly to his purchaser, sacrificing character, honour, principle, his whole individuality indeed for gain; a *mercenary* man acts with a view to profit in what he does, and is actuated by sordid motives, but he does not necessarily surrender himself unreservedly, or even make any sacrifice of principle. With the mercenary man love of gain is the chief motive; with the *venal* man it is in effect the only motive. *Hireling* denotes that hire is the motive, and thus implies something servile as well as mercenary, conveying more of contempt than of reprobatton.

In ventriloquism the sounds are formed by the same organs as the emissions of sound commonly—the larynx or organ of voice, the palate, tongue, &c.—the difference consisting mainly in the mode of respiration. A very full inspiration is taken, which is breathed out slowly and gradually, the sound of the voice being dexterously modified and diminished by the muscles of the larynx and the palate. At the same time the lips of the performer are scarcely moved, and the deception is still further facilitated by the attention of the auditors being directed to the object which is sought to be regarded as the source of the voice. Ventriloquism was known to the ancient Greeks as well as to the Romans.

In England the county in which the trial of a particular cause takes place is said to be the venue of that cause. Originally jurors were summoned from the immediate neighbourhood where a fact happened to try it by their own knowledge, but they are now summonable from the body of the county. A venue is either *transitory* or *local*. It is *transitory* when the cause of action is of a sort that might have happened anywhere, and *local* when it could have happened in one county only. (See *Local Action*, *Transitory Action*, under LOCAL, TRANSITORY.) By the Judicature Act, 1875, the venue in all cases, civil and criminal, may be regulated by order in council.—To lay a venue, to allege a place.

In myth. the goddess of beauty and love, and more especially of sensual love. Venus was originally the Roman goddess of the spring, but at a comparatively late period she became identified with the Greek *Aphrodite*. She is represented as the highest ideal of female beauty and love, and was naturally a favourite

subject with the ancient poets and artists, some of her statues being among the noblest remains of Greek and Roman sculpture. Among the most famous of her statues are the Venus of Cnidus, by Praxiteles, of which the Venus de Medici, found in the Villa Hadriana at Tivoli, is supposed to be a free copy, and the Venus of Milo or Melos, found in the island of Melos.

Among the modern statues one of the most famous is the Venus of Capri, where she is represented as issuing from the bath.—2. In astron. one of the inferior planets, having its orbit between Mercury and the earth, and the most brilliant of all the planetary bodies. From her alternate appearance in the morning and evening she was called by the ancients *Lucifer* and *Hesperus*, the morning and evening star. The mean distance of Venus from the sun is about 66,134,000 miles; her diameter 7510 miles; and her period of revolution round the sun about 224.7 mean solar days. Her volume is equal to about 1/14th of the earth, but her density being slightly greater her mass is actually equal to about 1/11th of the earth. She revolves about an axis, and the time of rotation is about 23h 21m, the axis of rotation being inclined to the ecliptic at an angle of about 75°. Her greatest angular distance from the sun is from 45° to 47° 12'. According to her various positions relatively to the sun and earth she changes her phases like the moon, appearing full at the superior conjunction, gibbous between that point and the point of her greatest elongation, half-mooned at these points, and crescent-shaped or horned between these and the inferior conjunction. Like Mercury, Venus transits the face of the sun, but at longer intervals. The transits of Venus are of much more importance than those of Mercury, because being nearer to us when in transit her position on the sun is measurably different for observers placed on different parts of the earth. See TRANSIT.—3. In old chem. a name given to copper.—4. In her. the green tincture in coat armour when borne by princes; vert.—5. A Linnæan genus of lamellibranchiate molluscs, family Veneridae. hellebore.] A well-known genus of plants belonging to the nat. order Melanthaceæ. *Veratrum album* (common white hellebore)

**Veray**, † **Verray**, † *a.* [O. Fr. *verai*, Mod. Fr. *vera*. See **VERY**.] True. *Chaucer*.

**Verb** (vɛrb), *n.* [Fr. *verbe*, from L. *verbum*, a word, a verb; from same root as E. *word* (which see).] 1. † A word.

That so it might appear, that the assistance of the spirit, promised to the Church, was not a vain thing, or a mere verb. *South*.

2. In *gram.* that part of speech whose essential function is to predicate or assert something in regard to something else (the subject or thing spoken of); as, the boy runs, the man lifts the stone, fishes swim, he suffers much. Verbs have the power of indicating time and mode by means of tenses and moods, but this is not an essential property. They have been divided into *active* and *neuter verbs*, according as they predicate action or state. Active verbs are divided into *intransitive* and *transitive*, according as the action is confined to the actor or passes from him to an object. Intransitive verbs often take an objective of their own nature; as, he runs a race; he sleeps the sleep of death. When a verb may be used either transitively or intransitively, as, he walks the horse, he walks to church, the verb in the former use is said to be *causative*. Many causative verbs are distinguished from their corresponding intransitives by a change of form, as *sit, set; tie, lay; fall, fell*. Some verbs are sometimes transitive, sometimes intransitive, and sometimes neuter; as, he floats a scheme; John can float now; the corpse floats. A small class of verbs, as, *become, exist, wax, and grow* (in such phrases as, my hair becomes white; he waxes weak; he grows old), predicating only existence or transition from one state to another, are called *substantive verbs*, and this name is sometimes restricted to the verb *to be*. *Passive verbs* affirm suffering or endurance of what another does. Hence, only verbs which take an object after them can have a passive voice, because it can be said of objects only that they suffer or endure the action directed on or towards them by the subject of the active verb. Passive verbs are thus the correlatives or complements of active verbs. The infinitive mood, gerund, and supine are properly verbal nouns, implying action or state only without the power of assertion. Participles are adjectives plus the notion of time, and cannot therefore assert.

**Verbal** (vɛr'bal), *a.* [Fr. *verbal*, L. *verbalis*. See **VERB**.] 1. Spoken; expressed to the ear in words; not written; oral; as, a verbal message; a verbal contract; verbal testimony. 'Made she no verbal quest.' *Shak.* 2. Consisting in mere words.

**Vernier** (vèr'ni-èr), *n.* [From the inventor, Peter Vernier, of Brussels, who died 1637.] A small movable scale, running parallel with the fixed scale of a sextant, theodolite, barometer, or other graduated instrument, and used for measuring a fractional part of one of the equal divisions on the graduated fixed scale or arc. It consists, in its simplest form, of a small sliding scale, the divisions of which differ from those of the primary scale. A space is taken equal to an exact number of parts of the primary scale, and it is divided into a number of equal parts either greater by 1 or less by 1 than the number that it covers on the primary scale. The diagram represents the vernier of the common barometer for measuring to the hundredth of an inch. The scale *ab* is divided into inches and tenths of inches; the small movable scale *cd* is the *vernier*, and consists of a length of eleven parts of *ab*, divided into ten parts, each part being therefore equal

to one and one-tenth of the divisions upon a b, and the difference between any division on the scale and vernier will be one-hundredth of an inch. In the figure the zero of the vernier is set to the division 30 inches, the division 10 upon the vernier corresponding with that of 25 inches 9 tenths on the scale. Hence, the vernier-division 1 is one-hundredth of an inch below the scale division 29 inches 9 tenths; division 2 on the vernier is two-hundredths below 29 inches 8 tenths, and so on. Supposing the vernier were raised any number of hundredths, as two hundredths of an inch, the division 2 would coincide with 29 inches 8 tenths. To read off the hundredths of an inch the vernier zero advances beyond any tenth on the scale; the division that coincides nearest with any on the scale must be taken for the hundredth required. The vernier now usually employed has one graduation more than the corresponding portion of the scale. The principle in both cases is, however, the same.

In *physics*, the oscillating or reciprocating motion made by a body, as a pendulum, a musical chord, or elastic plate, when disturbed from the position or figure of equilibrium, to recover that position or form again. When the reciprocating movement is comparatively slow, as that of the pendulum, which is produced by the action of gravity on the whole mass of the body, the term *oscillation* is commonly used; while the term *vibration* is generally confined to a motion with rapid reciprocations, as that of a sonorous body, and which proceeds from the reciprocal action of the molecules of the body on each other when a disturbance takes place in their state of equilibrium. The term *vibration* is also applied to the alternate or reciprocating motion which is produced among the particles of a fluid or ethereal medium when their equilibrium is disturbed by any impulse, by which means waves or undulations are caused. The laws of vibratory motion form the foundation of the theories devised by modern science to account for the phenomena of acoustics and optics. See **SOUND**, and **Undulatory Theory of Light** under **UNDEULATORY**.—*Amplitude of vibration*, the maximum excursion or displacement of a vibrating body or particle from a position of rest.—*Phase of vibrations*, a term used in reference to the vibrations of the particles of a wave of an elastic or liquid medium, which are said to be in the same phase when they are moving in the same direction.

**Vibrionidæ** (vī'brī-on-ī-dē), *n. pl.* A family or tribe of microscopic organisms, doubtfully animal, abounding in decaying paste and vinegar, called *microscopic æta* from their long filamentous bodies. Vibrionidæ occur in all infusions of animal or vegetable matter. In such infusions there appears first a thin scum or pellicle, consisting of extremely minute molecules. In a second stage these molecules appear to have increased in size by endogenous division till they form short staff-shaped filaments called Bacteria. These Bacteria increase in length by the same process till they assume the form of Vibrionidæ, so named from the vibratile movements they exhibit. After a period they become motionless and disintegrated so as to be resolved back into a pellicle of fine molecules. By the advocates of spontaneous generation or heterogeny, it is affirmed that the Vibrionidæ are produced spontaneously from the molecular pellicle and not from any pre-existing germs; by panspermists, on the other hand, it is affirmed that they, as well as Bacteria, have their origin in innumerable germs existing in the fluid or in the atmosphere, or both. Some of the Vibrionidæ are found in plants, one, the *Vibrio tritici*, being parasitic in wheat, and producing the disease called *ear-cockles*.

A member of the lowest class of unfree persons during the prevalence of the feudal system; a feudal serf. In respect to their lords or owners the villains had no rights, except that the lord might not kill or maim them, or ravish the females; they could acquire or hold no property against their lord's will; they were obliged to perform all the menial services he demanded; and the cottages and plots of land they occupied were held merely at his will.

In respect, however, of other persons besides their lord they had the rights and privileges of freemen. Villains were either (*a*) *regardant*, or (*b*) in *gross*.

In the former case they were annexed to the soil (*ascripti* or *ascriptitii glebe*), belonging to a manor as fixtures, passing with it when it was conveyed or inherited; they could not be sold or transferred as persons separate from the land. **Villainage**, **Villainage** (vil'î-len-aj), *n.* [See *VILLAIN*.] A tenure of lands and tenements by base services. It was originally founded on the servile state of the occupiers of the soil, who were allowed to hold portions of land at the will of their lord, on condition of performing base and menial services.

Where the service was base in its nature, and undefined as to time and amount, the tenure received the name of *pure villainage*, but where the service, although of a base nature, was certain and defined, it was called *privileged villainage*, and sometimes *villain socage*. It frequently happened that lands held in villenage descended in uninterrupted succession from father to son, until at length the occupiers or villains became entitled, by prescription or custom, to hold their lands against the lord so long as they performed the required services.

And although the villains themselves acquired freedom, or their land came into the possession of freemen, the villain services were still the condition of the tenure, according to the custom of the manor. These customs were preserved and evidenced by the rolls of the several courts-baron, in which they were entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lay.

And as such tenants had nothing to show for their estates but the entries into those rolls, or copies of them authenticated by the steward, they at last came to be called *tenants by copy of court-roll*, and their tenure a *copy-hold*.

The disease manifests itself by the development of the fungus over the leaves or shoots as well as over the berries themselves, covering the affected parts with a white powdery-looking net-work of beaded fibres. Growth is soon arrested, and decay or drying up, accompanied with an offensive smell, follows. Sulphur is said to be a reliable remedy.

(b) A disease due to the invasion of the parasitic insect *Phylloxera vastatrix*, which, making its first appearance near Avignon in France in 1865, spread over in less than ten years a great part of the richest vine-growing regions of that country, almost entirely destroying the crops in several districts. When the *Phylloxera* attacks a vine the rootlets exhibit peculiar swellings, and the insects multiply so rapidly as soon to overrun all the roots, and by absorbing nourishment from the plant reduce it to a totally exhausted state. No certain remedy has as yet been discovered against this evil. Many other fungous and insect parasites attack the vine, but with far less destructive effects.

Vinegar may also be obtained from strong beer, by the fermentation of various fruits, or of a solution of sugar mixed with yeast. In short, all liquids which are capable of the vinous fermentation may be made to produce vinegar. 120 parts of water, 12 of brandy, 3 of brown sugar, 1 of tartar, and  $\frac{1}{2}$  of sour dough, if left for some weeks in a warm place, yield a strong and pleasant vinegar. All the above vinegars yield by distillation a purer and somewhat weaker acetic acid, called *distilled vinegar*.—*Radical vinegar*, a more concentrated solution of acetic acid, obtained by distilling 3 parts of dry powdered acetate of soda with 97 of oil of vitriol, as pure and concentrated as possible. This vinegar, holding camphor and essential oils in solution, constitutes the *aromatic vinegar* of the shops.—*Wood vinegar*, an impure acetic acid obtained by the distillation of wood; called also *Pyroligneous Acid*. **Viol** (viól), *n.* [Fr. *viola*, a viol; It. *viola*, Fr. *viola*, *viola*, M.L. *viola*, *viola*, a viol or similar stringed instrument. Diez takes the word from L. *vitulari*, to be joyful, to celebrate a festival. *Fiddle* may have the same origin. See FIDDLE.] An ancient musical instrument of much the same form as the violin, but having the belly and back flat, and with larger bends in the sides than that instrument. It may be considered as the parent of our modern instruments of the violin kind. The viol was a stringed instrument with frets, and played on by a bow. There were three sorts, treble, tenor, and bass, each having from three to six strings, which were tuned in fourths and thirds.

Viol da gamba.—From Harleian MS.

The *treble viol* was somewhat larger than our violin, and the music for it was written in the treble clef. The *tenor viol* was about the same length and breadth as the modern tenor violin, but thicker in the body, and the music for it was in the mezzo or C clef. The dimensions of the *bass viol* were much the same as those of the violoncello, and the music for it was written in the bass clef. The smaller viols were called *viol da braccio*, from being held by the arm; the larger, *viol da gamba*, from being placed between the legs. The viol da gamba held its place longer than the smaller viols, but at last gave way to the violoncello.—*Viol d'amore*, an obsolete instrument of the violin family. In addition to five or seven catgut strings,

the same number of metal strings, tuned in unison, were placed under the finger-board, which, by the production of sympathetic sound, gave a peculiar quality of tone to the instrument.—*Viola pomposa*, a species of *viol da gamba*, invented by Bach, having five strings, the four lower of which were tuned like the violoncello in fifths, and the fifth string was tuned to E.

**Viola** (vió-la), *n.* [It.] A large kind of violin, to which the part between the second violin and the bass is generally assigned. It has four catgut strings, of which the third and fourth are covered with silver wire. It is tuned C (in the second space of the bass staff), D, A, G, reckoning upwards, and is an octave higher in pitch than the violoncello, and a fifth lower than the violin. It is called also *tenor violin*, and *alto viola*, from the music being written for it in the alto clef.—*Viola di Bardone*. Same as *Barytone*.—*Viola pomposa*. See under VIOL.

The greatest favourites are the varieties of the *V. odorata*, or common sweet violet, and of *V. tricolor*, the pansy, or heart's-ease, *V. odorata* being especially esteemed for its fragrance and early appearance. The roots of several species of Viola were formerly used in medicine. They contain a bitter alkaloid (*violín*, which see), which acts as an emetic and purgative.

The order is divided into two tribes, *Violeæ* and *Alsinodineæ*. *Violeæ* chiefly consist of European, Siberian, and American plants; *Alsinodineæ* are South American and African plants. The roots of all the *Violaceæ* appear to be more or less emetic, a property which is strongly possessed by the South American species.

It is considered the most perfect of musical instruments, on account of its capabilities of fine tone and expression, and of producing all the tones in any scale in perfect tune. It forms with its cognates, the viola, violoncello, and double-bass, the main element of all orchestras. The principal parts of the violin are the *scroll* or *head*, in which are placed the pins for tuning the strings; the *neck*, which connects the scroll with the body, and to which is attached the *finger-board*, upon which the strings are stopped by the fingers of the left hand as it holds the neck in playing; the *belly*, over which the strings are stretched, and which has two f-shaped sound holes, one on each side; the *back* or *under side*; the *sides* or *ribs*, uniting the back and belly; the *tail-piece*, to which the strings are fastened; and the *bridge*. The four strings of the violin are tuned at intervals of fifths, G, on the upper space of the bass staff, D, A, E reckoning upwards. Every interval semitone in its ordinary compass of 3½ octaves may be produced by stopping the strings, and the compass may be almost indefinitely extended upwards by the harmonics produced by touching the strings lightly. The violin can, to a limited extent, be made to produce harmony by sounding two or three strings together. Instruments of the violin kind are of great antiquity.

Potential. *Stillingfleet*.—*Virtual focus*, in optics, the point from which rays which have been rendered divergent by reflection or refraction appear to issue.—*Virtual velocity*, in mech. the velocity which a body in equilibrium would actually acquire during the first instant of its motion, in case of the equilibrium being disturbed. The principle of *virtual velocities* may be thus enunciated: 'If any system of bodies or material points, urged each by any forces whatever, be in equilibrium, and there be given to the system any small motion, by virtue of which each point describes an infinitely small space, which space will represent the virtual velocity of the point; then the sum of the forces, multiplied each by the space which the point to which it is applied describes in the direction of that force, will be always equal to zero or nothing, regarding as positive the small spaces described in the direction of the forces, and as negative those described in the opposite direction.' This great prin-

ciple is easily verified by experiment with respect to the six mechanical powers, but it applies immediately and most evidently to all questions respecting equilibrium or statical problems, and it furnishes a very easy method of ascertaining the power of any machine, or the proportion between two forces which would balance one another. For according to this principle the power multiplied by the space through which it moves in the vertical direction must always be equal to the weight multiplied by the space through which it moves in the vertical direction.

The Brahmanic myths relating to Vishnu are characterized by the idea that, whenever a great physical or moral disorder affected the world, Vishnu descended in a small portion of his essence to set it right. Such descents are called *avatāras* or *avatars*, and consist in Vishnu's assuming the

form of some wonderful animal or superhuman being, or as being born in human form of human parents, and always endowed with miraculous power. These avatars are generally given as ten, nine of which are already past, the tenth, the *Kalki-avatāra*, being yet to come, 'when the practices taught by the Vedas and the institutes of the law shall have ceased, and the close of the *Kali* or present age shall be nigh.'

Vishnu is sometimes represented as riding on Garuda, a being half bird and half man; as holding in one of his four hands a conch-shell blown in battle, in another a disc, an emblem of supreme power; in the third a mace as the emblem of punishment; and in the fourth a lotus as a type of creative power.

The cultivation of the vine extends from near 55° north latitude to the equator, but in south latitudes it only extends to about 40°. It is rarely grown at a greater altitude than 3000 feet. In favourable seasons the vine ripens in the open air in England, and in the eleventh and twelfth centuries considerable quantities of inferior wine were made from native grapes. creatures, whether men or animals; especially, human utterance in speaking, singing, or otherwise; the sound made when a person speaks or sings; mode or character of sounds uttered; as, to hear a *voice*; to recognize a person's *voice*; a loud *voice*; a low tone of *voice*; 'a man's *voice*;' 'did utter forth a *voice*;' 'the *voice* of a nightingale.' *Shak.*

Gentle and low, an excellent thing in woman.  
*Shak.*

The women sang  
Between the rougher *voices* of the men,  
Like linnets in the pauses of the wind. *Tennyson.*

*Voice* as a scientific term may mean either the faculty of uttering audible sounds, or the body of audible sounds produced by the organs of respiration, especially the larynx of men and other animals; contradistinguished from *speech* or *articulate language*. *Voice* is produced when air is driven by the muscles of expiration from the lungs through the trachea and strikes against the two vocal chords (see under *VOCAL*), the vibrations of which produce sounds varying in different animals according to the structure of the organs and the power which the animal possesses over them. *Voice* can, therefore, only be found in animals in which the system of respiration is developed, and the lungs and larynx actually exist. Fishes having no lungs are dumb. In man the superior organization and mobility of the tongue and lips, as well as the perfection of the larynx, enable him to modify his vocal sounds to an almost infinite extent. In ordinary speaking the notes of the voice have nearly all the same pitch, and the variety of the sounds is due rather to articulation in the month than to definite movements of the glottis and vocal chords. In singing the successive sounds have vibrations corresponding in relative proportions to the notes of the musical scale. The male voice admits of division into tenor and bass, and the female into soprano and contralto. The lowest female note is an octave or so higher than the lowest note of the male voice; and the female's highest note is about an octave above that of the male. The compass of both voices taken together is about four octaves, the chief differences residing in the pitch and also in the timbre. 2. The faculty of speaking; as, to lose one's *voice*.—3. A sound produced by an inanimate object and regarded as representing the voice of an intelligent being; sound emitted; as, the *voice* of the winds. 'The trumpet's *voice*.' *Addison.*

9. In *phonetics*, sound uttered with resonance of the vocal chords, and not with a mere emission of breath; sonant utterance. All consonants are really checks, and their character consists in their producing for a time a complete cessation of audible breath or *voice*. Both *p* and *b*, therefore, are momentary negations of breath and *voice*. But *b* differs from *p* in so far as, in order to pronounce it, the breath must have been changed by the glottis into *voice*. *Max Müller.*

10. In *gram.* that form of the verb or body of inflections which shows the relation of the subject of the affirmation or predication to the action expressed by the verb. In Eog-

2. Having the quality of passing off by spontaneous evaporation; evaporating rapidly; diffusing more or less freely in the atmosphere. Substances which affect the smell with pungent or fragrant odour, as musk, hartshorn, and essential oils, are called volatile substances because they waste away on exposure to the atmosphere. Alcohol and ether are called volatile liquids for a similar reason, and because they easily pass into the state of vapour on the application of heat. See OIL.—3. Lively; brisk; gay; full of spirit; airy; hence, fickle; apt to change; as, a volatile temper.

Volcano (vol'kâ-nô), n. pl. Volcanoes (vol'kâ-nôz). [It. volcano, vulcano, Fr. vulcan, from L. Vulcanus, the god of fire; cog. Skr. ukâ, fire.] A hill or mountain more or less perfectly cone-shaped, with a circular cup-like opening or basin (called a crater) at its summit; popularly termed a burning mountain. In the centre of the crater is the mouth of a perpendicular shaft, which sends out clouds of hot vapour, gases, and, at times of increased activity, showers of ashes, hot fragments of rocks, and streams of fiery liquid rocks, called lava, which flow down the slopes of the mountain. The gradual accumulation of these ejected materials

Section of an active Volcano.

around the crater forms a succession of concentric layers which explains the conical shape. The mountain has often several subsidiary cones connected with the principal, and lava may flow out from various mouths or vents. The flames described as issuing from the crater are usually the reflection of the glowing lava illuminating the clouds of vapour, scorie, and ashes. Nearly all active volcanoes have times of relative repose, interrupted, often at great intervals, by periods of increased activity, which terminate in a violent ejection of incandescent matter from the interior. The volcano is then said to be in a state of eruption, which is usually foreboded by loud subterranean noises, like explosions of distant artillery, shocks of earthquake, &c. The most important European volcanoes are Vesuvius, near Naples, whose sudden eruption in 79 A. D. overwhelmed Pompeii, Herculaneum, and other cities; Etna, in the island of Sicily; and Hecla in Iceland.

A volcano has been described by Sir Charles Lyell as 'a more or less perfectly conical hill or mountain, formed by the successive accumulations of ejected matter in a state of incandescence or high heat, and having one or more channels of communication with the interior of the earth, by which the ejections are effected.' Some are terrestrial, others aquatic. The common vole (A. agrestis), the meadow-mouse or short-tailed field-mouse, is injurious to young plantations, devouring the bark and destroying the roots. The water-vole or water-rat (A. amphibia) is much larger, and swims well though its feet are not webbed. A black variety of the water-vole common in Britain is the A. atra. There are many other species in the Old and New Worlds. See ARVICOLA.

'Will' is an ambiguous word, being sometimes put for the 'faculty of willing; sometimes for the 'act' of that faculty, besides other meanings. But vollition always signifies the 'act of willing,' and nothing else. Willingness, I think, is opposed to unwillingness or aversion. A very simple volunometer consists of a globular flask with a narrow neck, about 12 inches long, and graduated from below upwards to indicate grains of water. The flask has a tubulure, accurately fitted with a ground stopper, for admitting the solid body to be measured. The instrument being filled to the mark 0° on the neck with a liquid, as water, which does not act upon the solid, it is inclined on one side, the stopper removed, and the solid body introduced. The stopper is then replaced, and the number of divisions through which the liquid is raised in the stem gives at once the volume of the body in grain-measures. *Watts's Dict. of Chem.*

The oldest volunteer company in Britain is the Honourable Artillery Company of London, whose charter dates from the reign of Henry VIII. In 1794, and again in 1803, when the ambition and threats of France agitated England, the government reckoned upon having a force of half a million efficient volunteers in arms; but by 1815 this force almost ceased to exist. About 1857 a feeling of insecurity began to manifest itself in consequence of the alleged inefficiency of the national defences, and several volunteer corps were formed. In the course of two or three years many thousands of volunteer riflemen were enrolled throughout the kingdom. Corps of artil-

lerymen, engineers, &c., were subsequently formed. These bodies of men the British government provides with competent instructors, arms, and a part of their ammunition, besides allowing to each corps certain grants calculated on the number of the efficient members, &c. A volunteer can resign on giving a fortnight's previous notice, unless when the country is reasonably considered in imminent danger.

It is more particularly applied to a whirlpool or a body of water moving with a circular motion, and forming a cavity in the centre, into which all bodies coming within its influence are drawn and engulfed. 'Roll in her vortex and her power confess.' *Pope.* 'The huge vortex of Norse darkness.' *Carlyle.* — 2. Recent labours in the theoretical investigation of the motion of vortices, more particularly the theorems relating to vortex filaments rotating round a central axis in a frictionless or perfect fluid, have suggested the possibility of founding on them a new form of the atomic theory.

**Vowel** (vou'el), *n.* [Fr. *royelle*, from L. *vocalis*, lit. a vocal letter, from *vox*, *voeis*, the voice. See VOICE.] 1. A sound uttered by simply opening the mouth or vocal organs; a sound uttered when the vocal organs are merely in an open position, as the sound of *a* or *o*. Vowels are distinguished from consonants in that the former can be pronounced by themselves, while consonants require to be sounded with the aid of a vowel.

When the voice is not further modified by contact, partial or complete, of the lips or tongue, but flows through an open channel without any friction or hissing, then we have *vowel* sound. When on the other hand the sound is not complete until the action of some part of the organs of the mouth has ceased,

then we have produced what we may call *consonantal* sound. Briefly, 'a *vowel* is the result of an open position of the oral organs; an articulation (this is Mr. Bell's term for *consonant*) is the result of an opening action of the organ.' *Fetie.*

but by others his lameness is attributed to his having been thrown from Olympus. Vulcan patronized handicraftsmen of every kind,

**Vulcanite** (vul'kan-it), *n.* 1. A kind of vulcanized caoutchouc differing from ordinary vulcanized caoutchouc in containing a larger proportion of sulphur—from 30 to 60 per cent.—and in being made at a higher temperature. It is of a brownish-black colour, is hard and tough, cuts easily, and takes a good polish, on which account it is largely used for making into combs, brooches, bracelets, and many other ornaments. It is not affected by water or any of the other caoutchouc solvents. As it is especially distinguished by the large quantity of electricity which it evolves when rubbed, it is much used in the construction of electric machines. Called also *Ebonite*.—2. **Vulcanization** (vul'kan-iz-ā'shon), *n.* A method of treating caoutchouc or india-rubber with some form of sulphur to effect certain changes in its properties, and yield a soft (*vulcanized india-rubber*) or a hard (*vulcanite*) product. This was originally effected by dipping the rubber in melted sulphur and heating it to nearly 300°. Several other methods have been employed, probably the best of which for general purposes consists in mechanically mixing the rubber at a moderate heat with flowers of sulphur, and subsequently 'curing' it in superheated steam at from 250° to 300° Fahr. Other ingredients, as litharge, white-lead, zinc-white, whiting, &c., are added to the sulphur to give colour, softness, &c., to the rubber. The substance thus formed possesses the following properties: it remains elastic at all temperatures; it cannot be dissolved by the ordinary solvents, neither is it affected by heat within a considerable range of temperature; finally, it acquires extraordinary powers of resisting compression, with a great increase of strength and elasticity. Vulcanized india-rubber is employed with great success for very many useful purposes: for waterproofing cloth, for boots, shoes, mats, toys, belting, buffers, wheel-tires, washers, valves, pipes, fire-hose, medical and surgical appliances, &c. Hard vulcanized rubber is known as *ebonite* or *vulcanite*. See *VULCANITE*.

dead carcasses and offal. Their geographical distribution is confined chiefly to warm countries, where they act as scavengers to purify the earth from the putrid carcasses with which it would otherwise be encum-

bered. The Vulturidæ are divided into several genera, the chief being Vultur, Cathartes, Sarcorhamphus, Neophron, and Gypætos, of which the last approaches to the Falconidæ in its characters and habits, having the head feathered and not always feeding on carrion, but often attacking living animals. W.

**W** is the twenty-third letter of the English alphabet. It takes its form and its name from the union of two V's, the character V having formerly the name and force of U. (See V and U.) The name, double u, however, being given, to the letter from its form or composition, and not from its sound, is not a very suitable one. In the Anglo-Saxon alphabet it had a character with a distinctive form of its own, the more modern letter being adopted in the thirteenth century. This letter is used to represent two sounds, the one which distinctively belongs to it being that which it has at the beginning of a syllable and followed by a vowel, as in *wave, will, dwell, away, forward, &c.* This sound has somewhat the character of a vowel, and *w* in such a position is hence often spoken of as a semi-vowel. It is formed by opening the mouth with a close circular configuration of the lips, the organs having exactly the position they have in pronouncing the *oo* of *foot*. Yet it has not really a vowel sound in such cases, and *well*, for instance, is not equivalent to *oo-well*. This fact is more conclusively shown by such words as *wood, wool, woman*, in which the *oo*-sound is distinctly preceded by a consonant. Its true character is also shown by the definitions given by the best modern phonologists for a consonant and a vowel. Thus, Mr. Melville Bell defines a vowel as the result of an open position of the oral organs; an articulation (or consonant) as the result of an opening action of the organs. It is this opening action that marks *w* as distinct from *oo*, yet pronounced in a drawing manner it is hardly different in force. At the end of syllables, in which position it is always preceded by a vowel, it has either no force at all (or at most lengthens the vowel), as in *law, lawful, to row, low, hollow, &c.*, or it forms the second element in a diphthong, as in *now, vow, new, few*, being then really a vowel, and equivalent to the *u* in *neutral, bough, &c.* Followed by *r* it is initial in a considerable number of English words, as *wrap, write, wrong, &c.* It is now silent in such positions, though it was long sounded, as it still is in Scotland. *Wh* is another initial combination, as in *what, where, whale, whet, &c.* In Anglo-Saxon these words were spelt with *hw* (which in cognate words represents Icel. *hv*, *L. qu* initial), there being a guttural sound originally heard before the *w*. In Scotland, in such words as *what, whale*, a very decided guttural is heard before *w*. With the best speakers of modern English, however, *wh* seems to be *w* with a slight aspiration after it, though there is a tendency to pronounce *w* pure and simple. In Anglo-Saxon *ui* was also an initial sound; thus *uisp* was originally *uisp*, the *w* having

disappeared. It has also disappeared from *tree, knee, four, ooze, such, sister, &c.*; and, as above-mentioned, it is not heard in many words, to which may be added such as *second, two, answer, quitted, &c.* In many words it has taken the place of an older *g*, as in *law, man, &c.* (See G.) It has intruded itself into *whole, where, &c.* *W* coming before *a* often has the effect of giving the latter an *o*-sound (comp. *wad, wallow, water, &c.*); *qu* (= *kw*) has the same effect.—As an abbreviation *W* stands for west; *W.N.W.* for west-north-west; *W.S.W.* for west-south-west, &c.

The party whose opinion proves to be correct receives what has been staked by both. By statutes of England, Scotland, and the United States, all contracts or agreements, whether by parole or in writing, depending on wagers, are null and void, and the wager or money due thereon cannot be recovered in any court of law. A wager is therefore merely a debt of honour, and if paid it is in the eye of the law the same thing as giving a gratuity.

Besides these plates for horse races, the *wagers* may be as the persons please. *Sir W. Temple.*

For most men (till by losing rendered sager)  
 Will back their own opinion by a *wager*. *Byron.*

Sir P. Sidney.

4. In *law*, an offer to make oath of innocence or non-indebtedness; or the act of making oath, together with the oaths of eleven compurgators, to fortify the defendant's oath.—*Wager of battle* or *battle*. See under *BATTLE*.—*Wager of law* was formerly a mode of trial, whereby in an action of debt brought upon a simple contract between the parties, without any deed or record, the defendant might discharge himself by taking an oath that he owed not the plaintiff anything; but he required to bring with him eleven persons of his neighbours, called *compurgators*, who were to avow upon their oath that they believed in their consciences that he declared the truth.—*Wager policy*. See under *WAGERING*.

*Wages*, then, depend mainly upon the demand and supply of labour. *J. S. Mill.*

*Note.* In ordinary language the term *wages* is usually restricted to the remuneration for mechanical or muscular labour, especially to that which is ordinarily paid at short intervals, as weekly or fortnightly, to workmen. Correctly speaking, however, what is called the *fees* of professional men, as lawyers, physicians, &c., the *salaries* of public functionaries, business men, &c., the *pay* of military and naval men, and the like, are all *wages*. Sax. *wagen*, *wægn*, *wæin*, which in later times became *wain*; D. and G. *wagen*, *Icel.* and Sw. *vagn*, Dan. *vogn*; lit. a carriage, what carries, from root seen in A. Sax. *regan*, *Icel.* *rega*, to carry; cog. Skr. *vah*, L. *veho*, to carry (whence *vehicle*).] akin also to *way*, *wag*, *weigh*, &c. *Skeat* remarks that *wagon* cannot come directly from the A. Sax., *wain* being the word that has directly descended from it (with same change of form as in *rain*, *hail*, *nail*, &c.). He therefore regards *wagon* as borrowed from the Dutch in the fifteenth or sixteenth century. Yet it seems strange that with *wain* in common usage we should have borrowed another word of the same signification.] 1. A four-wheeled vehicle for the transport of heavy loads. The English wagon is usually a strong heavy machine drawn by two horses yoked abreast. The fore wheels are much smaller than the hind pair, and their axle is swivelled to the body of the wagon to facilitate turning. The bodies of most wagons are set on springs on account of the weight of the vehicle and the absence of the steadying power of the horse, who expends his force in pulling only, the weight being distributed over the four wheels. Common varieties of the wagon are the brewer's dray, the railway lorry, and the agricultural wain. Wagons, such as are used by carriers, are frequently provided with wooden bows, over which a covering of heavy canvas or the like may be stretched to protect their contents from rain. The ends of the bows are inserted in staples on each side of the vehicle, so that tilt and bows can be readily removed when not required. In the United States wagons of a much lighter build, and drawn by one horse only, are much used for the conveyance of passengers and light commodities.—2. Tents were erected in the churchyard to supply refreshments to the crowd on the morrow, which was kept as a holiday. trouble; akin to Mod. G. *wirren*, to embroil, confuse; D. *war*, entanglement, confusion, *warren*, to disturb, to embroil. Supposed to be connected with *worse*, through the sense of entanglement or confusion.] 1. A contest between nations or states (*international war*), or between parties in the same state (*civil war*), carried on by force of arms, usually arising, in the first case, from disputes about territorial possessions and frontiers, unjust dealings with the subjects of one state by another, questions of race and sentiment, jealousy of military prestige, or mere lust of conquest, rarely nowadays from the whim of a despot; in the second case, from the claims of rival contenders for supreme power in the state, or for the establishment of some important point connected with civil or religious liberty. In all cases the aim of each contending party is to overthrow or weaken the enemy by the defeat or dispersion of his army or navy, the occupation of important parts of his country, such as the capital or principal administrative and commercial centres, or the ruin of his commerce, thus cutting off his sources of recuperation in men, money, and material. International or public war is always understood to be authorized by the monarch or sovereign power of the nations; when it is carried into the territories of a hitherto friendly power it is called an *aggressive* or *offensive* war, and when carried on to resist such aggression it is called *defensive*. Previous to the outbreak of hostilities between states, the power taking the initiatory step issues a *declaration of war*, which now usually takes the form of an explanatory manifesto addressed to neutral governments. During the progress of the struggle certain *laws, usages, or rights of war* have come to be generally recognized; such laws permitting the destruction or capture of armed enemies, the destruction of property likely to be serviceable to them, the stoppage of all their channels of traffic, and the appropriation of everything in an enemy's country necessary for the support and subsistence of the invading army. On the other hand, though an enemy may be starved into surrender, wounding, except in battle, mutilation, and all cruel and wanton devastation, are contrary to the usages of war, as are also bombarding an unprotected town, the use of poison in any way, and torture to extort information from an enemy; and generally the tendency in all laws and usages of war is becoming gradually more favourable to the cause of humanity at large.—2. Instruments of war. 'His compliment of stores, and total war.' *Prior*. [Poetical.]—3. Forces; army. [Poetical.]

5. The period of time during which one person or body of persons watch or stand sentinel, or the time from one relief of sentinels to another; hence, a division of the night, when the precautionary setting of a watch is most generally necessary. The Jews, like the Greeks and Romans, divided the night into military watches instead of hours, each watch representing the period for which each separate body of sentinels remained on duty. The proper Jewish reckoning recognized only three such watches: the first (lasting from sunset till about 10 P.M.), the second or 'middle watch' (10 P.M. to 2 A.M.), and the third, or 'morning watch' (from 2 A.M. till sunrise). After the establishment of the Roman power they were increased to four, which were named according to their numerical order, as first, second, &c., or by the terms *even*, *midnight*, *cock-crowing*, and *morning*, these terminating respectively at 9 P.M., midnight, 3 A.M., and 6 A.M. See Ex. xiv. 24; Judg. vii. 19; Lam. ii. 19; and Mat. xiv. 25; Mark xiii. 35.

6. *Naut.* (a) the period of time occupied by each part of a ship's crew alternately while on duty. The period of time called a *watch* is four hours, the reckoning beginning at noon or midnight. Between 4 and 8 P.M., the time is divided into two short or *dog-watches* in order to prevent the constant recurrence of the same portion of the crew keeping the watch during the same hours. Thus, the period from 12 to 4 P.M. is called the *afternoon watch*, from 4 to 6 the first *dog-watch*, from 6 to 8 the second *dog-watch*, from 8 to 12 the *first night watch*, from 12 to 4 A.M. the *middle watch*, from 4 to 8 the *morning watch*, and from 8 to 12 noon the *forenoon watch*. When this alternation of watches is kept up during the 24 hours, it is termed having *watch and watch*, in distinction from keeping all hands at work during one or more watches. *Anchor watch*, a small watch composed of one or two men appointed to look after the ship while at

anchor or in port. (b) A certain part of the officers and crew of a vessel who together attend to working her for an allotted time. The crew of every vessel while at sea is generally divided into two portions: the *star-board watch*, which in the merchant service is the captain's watch, and is often commanded by the second mate; and the *port-watch*, which in the merchant service is commanded by the chief mate. In the royal navy these watches are commanded by the lieutenants successively.—7. Anything by which the progress of time is perceived and measured; as, (a) † a candle marked out into sections, each of which was a certain time in burning.

Fetch me a bowl of wine. Give me a *watch*. *Shak.*

(b) A small time-piece, now universally circular in shape, to be carried in the pocket or about the person. The essential parts of a watch are the dial on which the hours, minutes, and seconds are marked, the hands which move round the dial pointing to these divisions, the train of wheels which carry round the hands, &c., the balance which regulates the motion of the wheels, and the coiled spring (the mainspring), whose elastic force produces the motion of the whole machinery, the movement being inclosed in a protecting case usually of gold or silver.—A *repeating watch* or *repeater* has in addition a small bell, gong, or other sounding object on which the hours, half-hours, quarters, &c., are struck on the compression of a spring. A *chronometer watch* or *pocket chronometer* is one of the finest kinds of watches fitted with a compensation balance and other devices which prevent the variations of temperature from affecting the regular movement of the watch. (See CHRONOMETER.) Watches were invented at Nuremberg about the beginning of the sixteenth century, and for a long time the wearing of a watch was considered in some degree a mark or proof of gentility. Thus Malvolio remarks in anticipation of his great fortune.

I know the while; and perchance wind up my watch, or play with my—some rich jewel. *Shak.*

8. In *pottery*, a trial piece of clay so placed in a kiln that it can be readily withdrawn to enable the workmen to judge by its appearance of the heat of the fire, and the condition of the ware remaining in the saggars.—The *Black Watch*, a name originally given to certain armed companies, whose uniform partly consisted of a dark tartan, and who were employed by government as an organized force about 1730 to watch the turbulent Highlands of Scotland. In 1739 these companies were embodied into a regular regiment, the 42d infantry regiment of the British army, which still retains the historic appellation of the *Black Watch*.—*Watch and ward*, the ancient custom of watching by night and by day in towns and cities. English writers up to the seventeenth century recognize a distinction between *watch* and *ward*, the former being used to signify a watching and guarding by night, and the latter a watching, guarding, and protecting by day. Hence, when the terms were used in combination, especially in the phrase to *keep watch and ward*, they implied a continuous and uninterrupted watching and guarding, constant vigilance and protection by night and by day.

**Water** (wa'tér), *n.* [O.E. *watere*, *weter*, *wæter*, A. Sax. *wæter*; O. Sax. *watar*. D. and L.G. *water*. G. *wasser*. The Scandinavian forms are somewhat different: Dan. *vand* (for *vadn*), Icel. *vattn*, Sw. *vatten*; similarly Goth. *vato* (pl. *vatna*). From a root *vad*, *ud*, seen also in *L. vadus*, wet, *unda*, a wave; Gr. *hydōr*, Skr. *udan*, water. Akk. *vet*. *Otter* is also from this root, lit. the water animal.] 1. A fluid, the most abundant and most necessary for living beings of any in nature, except air. Water, when pure, is transparent, inodorous, tasteless; a powerful refractor of light, an imperfect conductor of heat and electricity; it is very slightly compressible, its absolute diminution for a pressure of one atmosphere being only about 513 millionths of its bulk. Although water is colorless in small quantities, it is blue like the atmosphere when viewed in mass. It assumes the solid form,

that of ice or snow, at 32° F., and all lower temperatures; and it takes the form of vapour or steam at 212° F. under a pressure of 29.9 ins. of mercury, and retains that form at all higher temperatures. Under ordinary conditions water possesses the liquid form only at temperatures lying between 32° and 212°. It is, however, possible to cool water very considerably below 32° F. and yet maintain it in the liquid form; the vessel containing the water must be perfectly clean, and the water must be maintained in a state of perfect rest. Water may also be heated, under pressure, many degrees above 212° F. without passing into the state of steam. The specific gravity of water is 1 at 39° 2 F., being the unit to which the specific gravities of all solids and liquids are referred, as a convenient standard, on account of the facility with which it is obtained in a pure state; one cubic inch of water at 62° F., and 25.9 inches, barometrical pressure, weighs 252.453 grains. Distilled water is 815 times heavier than atmospheric air. Water is at its greatest density at 39° 2 F. (= 4° C.), and in this respect it presents a singular exception to the general law of expansion by heat. If water at 39° 2 F. be cooled, it expands as it cools till reduced to 32°, when it solidifies; and if water at 39° 2 F. be heated, it expands as the temperature increases in accordance with the general law. In a chemical point of view water exhibits in itself neither acid nor basic properties; but it combines with both acids and bases forming *hydrates*; it also combines with neutral salts. Water also enters, as a liquid, into a peculiar kind of combination with the greater number of all known substances. Of all liquids water is the most powerful and general solvent, and on this important property its use depends. Without water not only the operations of the chemist but the processes of animal and vegetable life would come to a stand. In consequence of the great solvent power of water it is never found pure in nature. Even in rain-water, which is the purest, there are always traces of carbonic acid, ammonia, and sea-salt. Where the rain-water has filtered through rocks and soils, and reappears as spring or river water, it is always more or less charged with salts derived from the earth, such as sea-salt, gypsum, and chalk. When the proportion of these is small the water is called *soft*, when larger it is called *hard water*. The former dissolves soap better, and is therefore preferred for washing; the latter is often pleasanter to drink. The only way to obtain perfectly pure water is to distil it. Distilled water is preserved in clean well stopped bottles, and used in chemical operations. Water is repositied in the earth in inexhaustible quantities, where it is preserved fresh and cool, and from which it issues in springs, which form streams and rivers. But the great reservoirs of water on the globe are the ocean, seas, and lakes, which cover more than three-fifths of its surface, and from which it is raised by evaporation, and uniting with the air in the state of vapour, is wafted over the earth ready to be precipitated in the form of rain, snow, or hail. Water is a compound substance, consisting of hydrogen and oxygen, in the proportion of 2 volumes of the former gas to 1 volume of the latter; or by weight it is composed of 2 parts of hydrogen united with 16 parts of oxygen. Its formula is H<sub>2</sub>O.—2. Water collected in a body; the ocean; a sea; a lake; a river; any collection of water. 'Such as travel by land or by water.' *Common Prayer.*

It occurs when opposite winds of different temperatures meet in the upper atmosphere, whereby a great amount of vapour is condensed into a thick black cloud, to which a vertical motion is given. This vertical motion causes it to take the form of a vast funnel, which, descending near the surface of the sea, draws up the water in its vortex, which joins in its whirling motion. The whole column, which after the junction extends from the sea to the clouds, assumes a magnificent appearance, being of a light colour near its axis, but dark along the sides.

Water-spout.

When acted on by the wind the column assumes a position oblique to the horizon, but in calm weather it maintains its vertical position, while at the same time it is carried along the surface of the sea. Sometimes the upper and lower parts move with different velocities, causing the parts to separate from each other, often with a loud report. The whole of the vapour is at length absorbed in the air, or it descends to the sea in a heavy shower of rain. Sudden gusts of wind, from all points of the compass, are very common in the vicinity of water-spouts. What are sometimes called *water-spouts on land* are merely heavy falls of rain of a very local character, and may or may not be accompanied with whirling winds. They occur generally during thunder-storms, and differ only from severe hail-storms in point of temperature.

**Wave** (wāv), n. [O.E. *wæve*, from A. Sax. *wæg*, a wave, a word perhaps allied to the verb to *wag*; Icel. *vágr*, G. *wage*, D. *veer*, a wave; the form of the word in English has been modified by the verb to *wave*, so that *wave* the noun may be regarded as a kind of hybrid word. See *WAVE*, v.t.] 1. An undulation, swell, or ridge on the surface of water or other liquid resulting from the oscillatory motion of its component particles, when disturbed from their position of rest by any force; especially, the rolling swell produced on the surface of the sea or other large body of water by the action of the wind; a billow; a surge. When the surface of a liquid is pressed down at any part, the adjoining parts rise, but sink again by the action of gravity; and acquiring a momentum proportionate to the mass and height, descend below the original level, displacing other parts near them, which rise and sink in a similar manner. The result is a reciprocating motion, the particles to which the primitive impulse was communicated being alternately the lowest and the highest, forming the series of ridges and hollows called *waves*. Where the depth of the liquid is invariable over its extent, or sufficient to allow the oscillations to proceed unimpeded, no progressive motion takes place, each ridge or column being kept in its place by the pressure of the adjacent columns. Should, however, free oscillation be prevented, as by the shelving of the shore, the columns in the deep water are not balanced by those in the shallower parts, and they thus acquire a progressive motion towards the latter, or take the form of *breakers*, hence the waves always roll in a direction towards the shore, no matter from what point the wind may blow. When waves are produced by the disturbance of a small quantity of the liquid, as when a pebble is thrown into a pool, they appear to advance from the disturbed point in widening concentric circles, the height of the wave decreasing gradually as it recedes from the centre; but there is no progressive motion of the liquid itself, as is shown by any body floating on its surface. The whole seems to roll onwards, but, in reality, each particle of water only oscillates with a vertical ascent and descent. The height of the wave depends in a great measure on the depth of the water in which it is produced. The waves of the ocean have been known in some instances to have reached a height of 43 feet, measured from the trough to the crest. The horizontal pressure of a strong Atlantic wave, as tested by Stephenson's marine dynamometer, has been recorded as high as 3 tons to the square foot. It is a matter of common observation that a wave of much greater dimension than others occurs at certain intervals, rolling much higher on the shore than those im-

mediately preceding or following it, or breaking with immense force over the decks of vessels on the open sea. This is caused when several coexisting series of waves moving with different velocities meet, and the crests of two or three of them become superimposed upon each other. Several series of waves moving in different directions may also coexist without destroying each other, giving rise to the chopping seas or cross swells so troublesome to mariners. The length of a wave is equal to the space between the most elevated points of two adjoining waves, or between the lowest points of two adjoining hollows. A wave is said to have passed through its length when its elevated part has arrived at the place where the elevated part of the next wave stood before; or the situation of two contiguous waves being given, when one of these has arrived at the place of the other; and the time which is employed in this transition is called the time of a wave's motion or the time of an undulation. The velocity of a wave is the rate at which the points of greatest elevation or depression seem to change their places.—*Tidal wave*. See *TIDE-WAVE*.—2. In *physics*, a vibration propagated from one set of particles of an elastic medium to the adjoining set, and so on; sometimes, but not always, accompanied with a small permanent displacement of such particles. The theory of the motion of waves is of great importance in physical science; since, not only is it connected with the phenomena of the waves of the ocean ordinarily produced by the wind, the tidal wave, &c., it has also a close relation to the phenomena of undulating musical strings, the undulations in solids, as in earthquake waves, &c., while we know that sounds in air are propagated as waves, and that even light is now generally held to be a form of wave-motion. See *SOUND*, *LIGHT*, *UNDULATORY*.—3. *Water*. [Poetical.]

L. *viscum*, G. *izos* (*izos*), mistletoe, birdlime.] 1. A thick, viscid, tenacious substance, excreted by bees from their bodies, and employed in the construction of their cells; usually called *Bees'-wax*. Its native colour is yellow, and it has a peculiar smell resembling honey, which is derived from the honey deposited in the cells. When bleached and freed from impurities, wax is white, brittle, and translucent in thin segments; it has neither taste nor smell; it has a specific gravity of from 0.960 to 0.966. It melts at 155° and softens at 80°, becoming so plastic that it may be moulded by the hand into any form. It is a mixture of three substances, called respectively myricin, cerotic acid, and cerolin, in very variable proportions. These substances are themselves composed of carbon, hydrogen, and oxygen. Wax is extensively employed both in its original and bleached state; in the latter state it is used for candles, and in numerous cerates, ointments, and plasters. It is also used in forming figures or images, busts, &c., in the preparation of anatomical models, in the preparation of artificial fruit, flowers, &c. In statuary it is used in making models for the metal cast.—2. Any substance resembling wax in appearance, consistence, plasticity, or other properties; as, (a) a vegetable product which may be regarded as a concrete fixed oil; the principal varieties being Chinese wax, cow-tree wax, Cuba wax, and Japan wax. It may be obtained from the pollen of many flowers, and it forms a part of the green fecula of many plants, particularly of the cabbage. It appears as a varnish upon the fruit and the upper surface of the leaves of many trees, as in the wax-palm and wax-myrtle. Called also *Vegetable Wax*. (b) A mineral product, one of certain fossil hydrocarbons which occur in small quantities generally in the carboniferous formations; called more fully *Mineral Wax*. The most familiarly known variety is ozocerite which see. (c) A thick tenacious substance excreted in the ear; ear-wax. (d) A substance found on the hinder legs of bees, derived from the pollen of flowers. This was long supposed to be the substance from which bees elaborated the wax for their cells, but this notion is now found to be erroneous. The pollen collected by bees serves for the nourishment of their larvae. (e) A substance used in sealing letters. See **SEALING-WAX**. (f) A thick resinous substance used by shoemakers for rubbing their thread.

The initial *w* or *v* is supposed to represent *m* of the old radical *ma*, *me*, *I*, and the suffix *x* (G. *r*) to be a relic of an old demonstrative *smā* joined to the first pronoun. Originally, therefore, *wē* = *ma-sma* = *I + that* (or *he*). See *U.S.*] *I* and another or others; *I* and *he* or *she*, or *I* and *they*. *We* is sometimes, like *they*, vaguely used for society, people in general, the world, &c., but when the speaker or writer uses *we* he identifies himself more or less directly with the statement; when he uses *they* he implies no such identification. **Weaver** (wév'ér), *n.* 1. One who weaves; one whose occupation is to weave.

*Weavers* were supposed to be generally good singers. Their trade, being sedentary, they had an opportunity of practising, and sometimes in parts. . . . Many of the *weavers* in Queen Elizabeth's days were Flemish Calvinists, who fled from the persecution of the Duke of Alva, and were therefore particularly given to singing psalms. . . . Hence the exclamation of Falstaff.

[The correct reading is 'sing psalma or anything.']—2. One of the aquatic insects of the genus *Gyrinus*; the whirlwig (which see).—3. A name given to inessential birds of various genera, belonging to the conirostral section of the order, and forming a group or sub-family (Ploceinae) of the Fringillidae or finches. They are so called from

Yellow-crowned Weaver and Nest (*P. intercephalus*).

the remarkable structure of their nests, which are woven in a very wonderful manner of various vegetable substances. Some species build their nests separate and singly, and hang them from slender branches of trees and shrubs, but others build in companies, numerous nests suspended from the branches of a tree being under one roof, though each one forms a separate compartment and has a separate entrance. They are natives of the warmer parts of Asia, of Africa, and of Australia, none being found in Europe or America. The *Ploceus intercephalus*, or yellow-crowned weaver, is a native of South Africa, and constructs an isolated pensile kidney-shaped nest, about 7 inches long by 4½ broad, with an opening in the side. Naturalists are not quite agreed

as to whether the nests of the weaver-bird are built in their own peculiar manner as a means of preservation against the rain, or against the attacks of serpents and small quadrupeds, probably the latter.

**Weaving** (wēv'ing), *n.* The act of one who weaves; the act or art of producing cloth or other textile fabrics by means of a loom from the combination of threads or filaments. In all kinds of weaving, whether plain or figured, one system of threads, called the *warp* or *west*, is made to pass alternately under and over the other system of threads called the *warp*, *web*, or *chain*. The essential operations are the successive raising of certain threads of the *warp* and the depression of others so as to form a decussation or *shed* for the passage of the weft yarn, which is then beaten up by means of a *lay* or *batten*. Weaving is performed by the hand in what are called *hand-loom*s, or by steam in what are called *power-loom*s, but the general arrangements for both are to a certain extent the same. (See LOOM, JACQUARD.) Weaving, in the most general sense of the term, comprehends not only those textile fabrics which are prepared in the loom, but also net-work, lace-work, &c.

A piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, &c. The wedge is a body contained under two triangular and three rectangular surfaces, as in the figure, where the triangles A B E, D C F are the ends, the rectangles A D E F, B C E F the sides, and the rectangle A B C D the top. The wedge is one of the mechanical powers, and is used for splitting blocks of timber and stone; for producing great pressure, as in the oil-press; and for raising immense weights, as when a ship is raised by wedges driven under the keel, &c. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the power would be to the resistance to be overcome, as the breadth of the back, D C, to the length of the side, D F, on the supposition that the resistance acts perpendicularly to the side. But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power, we require the additional elements of weight of the hammer, momentum of the blow, and the intervals between the blows, and further, the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration D F C. All cutting and penetrating instruments, as knives, swords, chisels, razors, axes, nails, pins, needles, &c., may be considered as wedges. The angle of the wedge in these cases is more or less acute, according to the purposes to which it is to be applied.—2. A mass of metal, especially if resembling a wedge in form. 'A *wedge* of gold of fifty shekels weight.' *Josh. vii. 21*. 'Wedges of gold, great anchors, heaps of pearls.' *Shak.*—3. Something in the form of a wedge.

See how in warlike muster they appear,

The term is, however, generally applied only to those contrivances which are employed for ascertaining the weight of heavy bodies, as the machines for the purpose of determining the weights of laden vehicles; machines for weighing cattle; machines for weighing heavy goods, as large casks, bales, &c. Some of these are constructed on the principle of the lever or steelyard, others on that of a combination of levers, and others on that of the spring-balance. A special feature of the majority of them is the large platform, on a level with or raised but as little as possible above the ground, so that vehicles or heavy goods to be weighed thereon may be easily transferred to and from it.

**Weigh** (wāt), *n.* [O. E. *weght*, *wight*, A. Sax. *ge-wiht*, from *wegan*. See WEIGH.] 1. That property of bodies by which they tend toward the centre of the earth; gravity; as, a body has *weight* or has no appreciable *weight*.—2. The measure of the force of gravity, as determined for any particular body; the measure of the force by which any body or a given portion of any substance gravitates or is attracted to the earth; in a more popular sense, the amount which anything weighs; the quantity of matter as estimated by the balance or expressed numerically with reference to some standard unit; as, a bar of metal having a *weight* of 5 lbs.; a load of 3 tons *weight*. In determining weight in cases where very great precision is desired, due account must be taken of temperature, elevation, and latitude. The apparent weight of any substance is less than its true weight by the weight of as much air as is displaced by it; therefore, as the density of the air is variable—air when warmed expanding very much more than any solid—a piece of metal appears to weigh more in warm than in cold weather. Moreover air becomes more dense by an increase of pressure, consequently when the barometer is high all heavy bodies become apparently lighter; when the baro-

meter is low they become apparently heavier. Now suppose a pound of iron and a pound of platinum are adjusted in light air and again compared in dense air, a slight change may be observed. For as a pound of iron is bulkier than a pound of platinum it displaces more air, and its apparent weight undergoes a greater change than does that of platinum. Hence in fixing exact standards of weight a particular temperature and pressure of air must be specified; thus the standard brass pound of Britain is directed to be used when the Fahrenheit thermometer stands at 62° and the barometer at 30". In the second place it must be observed that the attraction which the earth exerts upon bodies placed near it decreases with their distance from its centre, being inversely as the squares of the distances; thus a body weighing a pound at the level of the sea will weigh somewhat less when tested properly at the top of a mountain. In the third place, since the earth has a diurnal motion on its axis, every substance placed on it has a centrifugal tendency which in some degree modifies what otherwise would have been its gravitation; thus centrifugal tendency produces the earth's oblateness, and causes a variation in the intensity of gravitation from one latitude to another, a stone being heavier at lat. 60° N. for instance than at the equator.—*Standard of weight*, the unit of mass legally recognized in a state, and by which the weight of other bodies may be determined, and all other weights used in commerce adjusted. In Britain a certain brass weight is by statute settled as the imperial standard troy pound. This pound contains 5760 grains, and is divided into 12 ounces; the pound avoirdupois contains 7000 such grains, and is divided into 16 ounces. The standard of weight (as also that of length) is the same in the United States. Standard weights are easily connected with standard measures; the weight of a cubic inch of distilled water, for instance, may be taken as a standard. See **AVOIRDUPOIS**, **TROY**, &c.—3. A certain mass of brass, iron, lead, or other metal or substance to be used for determining the weight of other bodies; as, an ounce weight; a pound weight; a 56 lb. weight.—4. A particular scale, system, or mode of estimating the relative heaviness of bodies; as, avoirdupois weight; troy weight; apothecaries' weight.—5. A heavy mass; something heavy.

They are characterized by having fin-like anterior extremities, the posterior extremities having their place supplied by a large horizontal caudal fin or tail, and the cervical bones so compressed as to leave the animal without any outward appearance of a neck. Their abode is in the sea or the great rivers, and they resemble the fishes so closely in external appearance that not only the vulgar, but even some of the earlier zoologists regarded them as belonging to that class. The whales are usually divided into two families, the *Balenidæ* and the *Physeteridæ* or *Catodontidæ*. The *Balenidæ*, or whalebone whales, are distinguished by the absence of teeth, by the presence of baleen or whalebone, and by the nostrils being placed on the top of the head. The typical representative of this family is the common or Greenland whale (*Balæna mysticetus*), so valuable on account of the oil and whalebone which it furnishes. It is principally found in the Arctic seas, but it is

also found in considerable numbers in many other parts of the world. Its length is usually about 60 feet, and its greatest circum-

Greenland Whale (Balæna mysticetus).

ference from 30 to 40 feet. The razor-back whale, or northern orqual, is the Balænoptera borealis. It often measures about 100 feet in length, and from 30 to 35 feet in circumference. (See RORQUAL.) The Physeteridae or Catodontidae are characterized by the fact that the palate is destitute of baleen, and the lower jaw possesses a series of pointed conical teeth. The best known species of this family is the sperm-whale or cachalot (Physeter or Catodon macrocephalus), which averages from 50 to 70 feet in length. (See CACHALOT, SPERMACEET, where is out of spermaceti whale.) Some species of Delphinidae are also known as whales. See BELUGA, CAAING-WHALE. —Very like a whale, a phrase applied to anything very improbable, and implying disbelief in what is stated. It takes its origin from a well-known passage in Hamlet, act iii. sc. 2. —Whale's bone, an old term for ivory, perhaps from the circumstance that the ivory of Western Europe in the middle ages was the tooth of the walrus, which may have been confounded with the whale.

might have been given to *wheat*. It might have been called eared, nutritious, graceful, waving, the incense of the earth.' (In Sanskrit it was called the incense of the earth, *go-dhūma*.) 'But it was simply called the *white*, the white colour of its grain seeming to distinguish it best from those plants with which otherwise it had the greatest similarity. For this is one of the secrets of onomatopoeisis—that it should express, not the most important or specific quality, but that which strikes our fancy.' *Max Müller*.] A plant of the genus *Triticum*, and the seed of the plant, which furnishes a white flour for bread and is by far the most important species of grain cultivated in Europe. It grows readily in almost every climate; but its natural home seems to be a temperate climate, and the soils best adapted for its culture are rich clays and heavy loams. Of cultivated wheats there are many varieties, the difference, however, being mostly due to soil, climate, and mode of cultivation. Three primary varieties may be mentioned: (a) *T. hybernum* (*muticum*), winter or un-bearded wheat; (b) *T. aestivum* (*aristatum*), summer or bearded wheat; (c) *T. Spelta* (*ad-hærens*), spelt or German wheat, which is of much less value than the others, but grows on poorer soils and more elevated localities. White wheat and red wheat are names applied according to the colour of the grain, the red sorts being generally harder than the white, but of inferior quality, and the yield is less. Winter wheat is sown in the autumn, with the view of being harvested the following year; summer wheat is sown in the spring of the year in which it is reaped. The best English wheat yields from 75 to 85 per cent of fine flour, the inferior kinds only from 54 to 68 per cent. See *TRITICUM*.

to fifteen, among the chaffy flowers of the wheat, where they are hatched in about eight or ten days, producing little footless maggots, whose ravages destroy the flowers of the plant, and render it shrivelled and worthless. Wheels, as applied to carriages, usually consist of a nave, into which are inserted spokes or radii, which connect it with the periphery or circular ring. Wheels are most important agents in machinery, being employed in a variety of forms and combinations, for the purpose of transmitting motion, regulating velocity, converting one species of motion into another, reducing friction, and equalizing the effect of forces applied in an intermittent or irregular manner. They receive different names according to their forms and uses; as, *balance-wheel*, *cog-wheel*, *crown-wheel*, *dash-wheel*, *eccentric*, *fly-wheel*, *friction-wheel*, *latent-wheel*, *paddle-wheel*, *pinion*, *pin-wheel*, *planet-wheel*, *ratchet-wheel*, *scape-wheel*, *spur-wheel*, *tread-wheel*, *turbine*, &c., which are described at more or less length according to their importance under these headings.—2. I see the sailor at the *wheel*. *Tennyson*.

(d) An instrument of torture generally used for criminals of the most atrocious class, formerly employed in France and Germany. In some places it consisted of a carriage-wheel on which the criminal was placed with his face upwards, and his legs and arms extended along the spokes. On the wheel being moved round the executioner broke the wretch's limbs by successive blows with a hammer or iron bar, and after a more or less protracted interval put an end to the sufferings of his victim by two or three severe blows, called *coups de grâce* (mercy strokes), on the chest or stomach, or by strangling him. In Germany its use lingered down till the beginning of the present century.

4 † The burthen of a song: a doubtful explanation by Steevens.

You must sing, down a-down, an you call him a-down-a.  
O, how the wheel becomes it. Shak.

—*Wheel and axle*, one of the mechanical powers, consisting in its primary form of a cylindrical axle on which a wheel, concentric with the axle, is firmly fastened. By reference to figs. 1, 2, it will be seen that this power resolves itself into a lever of the

Fig. 1.

Fig. 2.

first order, in which the weight and power are at the ends, and the fulcrum between them. C is the centre or fulcrum; A C and B are the semi-diameters of the wheel and the axle; and on the principle of the lever the power is to the weight as AC is to CB. The wheel is grooved and carries a coil of rope; another rope is secured to the axle; and when the power is in motion, every revolution of the wheel raises the weight to a height equal to the circumference of the axle or cylinder. In a great many cases a crank takes the place of the wheel, and the circumference described by the handle is substituted for the circumference of the wheel. The power is increased by enlarging the wheel or lengthening the arm of the crank, or by diminishing the diameter of the cylinder; but there is a limit beyond which the increase cannot be obtained with safety. This is a modification of the wheel and axle, called the *double axis machine* or differential windlass, in which the power can be increased with more safety. This is shown in fig. 3, where

Fig. 3.

where *b* and *c* are two cylinders of different diameters, firmly fixed on the axis carrying the crank *a*. The rope is coiled round the smaller cylinder, carried through a pulley supporting the weight, and then attached to the large cylinder in a contrary direction. When in motion every turn of the crank lifts the weight to a height equal to half the difference between the circumferences of the two axes; and the power is therefore to the weight as this half difference is to the circumference of the power, or the circle described by the crank *a*. Hence the power is increased by making the axes more nearly of the same diameter; but there is a limit to this increase, since if *b* and *c* come to be of equal thickness, the weight would not rise at all, the rope, in that case, wound upon *b* being only equal to that unwound from *c*. (See under DIFFERENTIAL.) The *wheel and axle* is sometimes called the *perpetual lever*, in consequence of the power being continued by the revolution of the wheel. The common wind, the windlass, the capstan, and the treadmill are so many applications of the wheel and axle.—*Wheels within wheels*, a complication of circumstances, motives, influences, or the like.

It was notorious that after this secretary retired the king's affairs went backwards; *wheels within wheels* took place.  
Roger North.

These birds are commonly called *widow-birds*, but whether this be merely a translation of their Latin generic name *Vidua*, which may have been given from the sombre hue of the plumage, or whether it be a corruption of *Whidah*, is uncertain.

**Whig** (whig), *n.* [If the historical account below is correct, the origin would seem to be the Sc. word *whig*, to jog along briskly, the connections of this being doubtful.] 1. A designation given to the members of one of the great political parties in Britain. The term is of Scottish origin, and was first used in the reign of Charles II. According to Bishop Buroet it is derived from *whiggam*, a word which was used by the peasants of the south-west of Scotland in driving their horses. He tells us that people from this quarter used often to come to Leith with their horses for corn, and from this peculiar word were called *whiggamores*, contracted to *whigs*. In 1643, after the news of the Duke of Hamilton's defeat, the clergy of the west of Scotland stirred up the people to rise and march to Edinburgh, and they themselves marched at the head of their parishioners. The Marquis of Argyle and his party came and headed them. 'This was called the *whiggamores' inroad*, and ever after that all that opposed the court came, in contempt, to be called *whiggs*. From Scotland the word was brought to England, where it has since continued to be used as the distinguishing appellation of the political party opposed to the *Tories*. It was first assumed as a party name by that body of politicians who were most active in placing William III. on the throne of England. Generally speaking, the principles of the Whigs have been of a popular character, and their measures, when in power, tending to increase the democratic influence in the constitution. The term *Liberals* is now generally applied to the representatives of this party; while the extreme section of the party may be said to have decepted all connection with the Whigs, and have adopted the name of Radicals. See **TOBY**.—2. In *American hist.* (a) a friend and supporter of the principles of the revolution; opposed to *Tory* and *Royalist*. When they occur on land they give a whirling motion to dust, sand, part of a cloud, and sometimes even to bodies of great weight and bulk, carrying them either upwards or downwards, and scattering them about in all directions. The latter is made from various substances, as sugar, molasses, potatoes, but principally from unmalted grain, as Indian corn, barley, oats, &c., dried and ground up. The grain most largely used is Indian corn. Grain-whisky requires the same process of fermentation and distillation as malt-whisky, but is cheaper, from its greater yield, and because it saves the expensive process of malting. — *Whispering gallery* or *dome*, a gallery or dome in which the sound of words uttered in a low voice or whisper is communicated to a greater distance than under any ordinary circumstances. Thus in an elliptical chamber, if a person standing in one of the foci speak in a whisper he will be heard distinctly by a person standing in one of the other foci, although the same sound would not be audible at the same distance under any other circumstances or at any other place in the chamber. The reason is that the sounds produced in one of the foci of such a chamber strike upon the wall all round, and, from the nature of the ellipse, are all reflected to the other focus. This serves in some measure to explain the effects of *whispering galleries* and *domes* in general.

**Whist**† (whíst), *v. i.* To become silent. *Surrey*.

**Whist** (whíst), *n.* A well-known game at cards, said to be so called because the parties playing it have to be *whist* or silent, but this is doubtful. Another name was *whisk*. The game is played with the full pack of fifty-two cards by four persons, two being partners against the other two, each player receiving thirteen cards dealt out one by one in rotation. The last card dealt is turned face up, and is called the trump card; it gives a special power to the suit to which it belongs. The cards rank as follows: ace (highest), king, queen, knave, and the others according to their number of pips. Play is commenced by the person on the left hand of the dealer laying down a card face up on the table, the other players following in succession with cards of the same suit if they have them. When all have played the player who has laid the highest card takes the four cards laid down, which constitute a trick. The winner of the trick then leads, as the first of a new trick, the winner of which becomes the leader, and so on. When a player cannot play a card of the same suit, he may play one of the trump suit, and take the trick, or lay one of a different suit, which gives him no chance of winning the trick. When the hand is played out the score is taken as follows: the partners who conjointly gain the majority of tricks score one point for every trick taken above six. The ace, king, queen, and knave of the trump suit are called honours, and count one each for the side who holds them; if one side hold three honours, they count two by honours, as the opposite side can have but one; if one side hold all the honours, four by honours is counted; should the honours be equally divided neither side counts, the honours being then said to cancel each other. In *long whist*, an obsolete form of the game, ten of these points made a game. In *short whist*, the game now

generally played, the number has been reduced to five, and in this form it is common to count by tricks alone. A rubber consists of a series of three games, and is won by the side that secures two of them. Should one party gain two games in succession, the third of the rubber is not played.

Nares remarks on the following quotation that a hawk seems to have been usually cast off in this way against the wind when sent in pursuit of prey; with it, or down the wind, when turned loose or abandoned.

If I do prove her haggard  
Though that her jesses were my dear heart-strings  
I'd *whistle* her off, and let her down the wind,  
To prey at fortune. *Shak.*

Compare the following extract.

—To *pay* for one's *whistle*, or to *pay* dear for one's *whistle*, to pay a high price for something one fancies; to pay dearly for indulging one's whim, caprice, fancy, or the like. There are four or five varieties of this swelling, according to the texture primarily attacked. Should the skin be the primary seat of the inflammation vesicles appear, which soon discharge pus, giving rapid relief. Should the cellular or connective tissue beneath the skin or under the nail be affected, there is a painful feeling of tenseness and throbbing of the part, often accompanied by febrile disturbance until pus can be evacuated, which should be done by incision as soon as the presence and seat of the disease has been discovered. The most dangerous form of whitlow occurs, however, when the tendons and their sheaths or the periosteum are affected. In this form suppuration may extend above the wrist, and may occasion the loss of the finger, the hand, and may seriously, in some rare cases fatally, affect the health of the patient.—2. Lith. and O. Prus. *kas*, Rus. *koi*, L. *qui*, Gr. *kos*, *pos*, W. *puy*, Gael. and Ir. *co*, Per. *ki*. Skr. *ka*—who. *Whose*, *whom*, are found as relatives about the end of the twelfth century; 'but *who* not until the fourteenth century, and was not in common use before the sixteenth century.' *Dr. Morris*. In genuine idiomatist Scotch *who* or *wha* (including also the possessive and objective) is still only an interrogative, *that* or *at* being the relative. Akin are *wher*, *where*, *whither*, *which*, &c.] A relative and interrogative pronoun always used substantively (that is, not joined with a noun), and with relation to a person or persons. It remains uninflected for number, but has the form *whom* for the objective and *whose* for the possessive. (*Whose* is also used for the possessive of *which* or *that* used as a rela-

tive.) (a) Used interrogatively who = what or which person or persons?

*Who* hath weot? *who* hath contentions? *Prov. xxiii. 29.*  
*Whom* have I in heaven but thee? *Ps. lxxiii. 25.*

In such a sentence as, I do not know *who* you are, *who* is the indirect or dependent interrogative. (b) Used relatively—that.

I sought him *whom* my soul loveth. *Can. iii. 1.*  
Happy the man, and happy he alone,  
He *who* can call to-day his own. *Dryden*.

(c) Sometimes used elliptically for *he*, *they*, or *those*, *who* or *whom*.

*Who* talks much must talk in vain. *Gay*.  
*Whom* the gods love die young. *Rymer*.

—As *who should say*, as one who should say; as if he should say.

He wisely look'd on me  
As *who should say* 'I would thou wert the man.' *Shak*.

—*Who*, *Which*, *That*. These agree in being relatives, *who* being used for persons, *which* for things, and *that* being used indifferently for either. *Who* and *which* have well-defined different uses: (a) they connect two co-ordinate sentences; as, I met a policeman *who* showed me the way; I studied geometry *which* I found useful. Each of these sentences could be turned into two propositions grammatically, as well as logically, independent: I met a policeman *and* he showed me the way; I studied geometry *and* it I found useful. Another use of the same nature is when the second clause is of the kind termed adverbial, where we may still resolve *who* and *which* into a personal or demonstrative pronoun and a conjunction; as, why should we condemn James *who* (for *he*, seeing *that he*) is innocent? why should we study phrenology *which* (seeing *that it*) is profitless? (b) They are often used to introduce subordinate or adjectival clauses, which serve to define or explain a noun regarding which a statement is made in the principal clause; as, I saw the man *who* first taught me to swim; the house *which* he built still stands. Now, in these latter uses, *who* and *which* cannot be turned into *and he*, *and it*. The following sentence, standing alone, is ambiguous: 'I re-read the book *which* gave me much pleasure.' This may mean either that the re-reading gave much pleasure, and in that case the sentence consists of two co-ordinate sentences and belongs to section (a), or it may mean I re-read the book *which* when formerly read gave me much pleasure. In the latter case the second clause limits or explains the object of the first and belongs to section (b). To remove such ambiguity, and the unpleasant effect arising from the too frequent use of *who* and *which*, it has been proposed by some grammarians (especially Professor Bain) always to employ *that* and not *who* or *which*, when the relative is used to introduce a restrictive or adjectival clause, and instead of saying 'the man *who* hath no music in himself . . . is fit for treasons, &c.' 'they are the books . . . *which* nourish all the world,' to say, as Shakspeare says, 'the man *that* hath, &c.' 'they are the books . . . *that* nourish, &c.' reserving *who* and *which* for such cases as are noticed under section (a). See also THAT.

Will (wil), n. [A. Sax. willa, will, from wilan, to desire; D. wil, Icel. vil, Dan. villie, Sw. and Goth. vilja, O.H.G. willo, willo. See the verb.] 1. That faculty or power of the mind by which we determine either to do or not to do something which we conceive to be in our power; the faculty which is exercised in deciding, among two or more objects, which we shall embrace or pursue; the power of producing acts of willing; the power of control which the mind possesses over its own operations.

Appetite is the will's solicitor, and the will is appetite's controller; what we covet according to the one, by the other we often reject. Hooker.

Every man is conscious of a power to determine in things which he conceives to depend upon his determination. To this power we give the name of will. Reid.

2. The act of willing; the act of determining choice or forming a purpose; volition.

It is necessary to form a distinct notion of what is meant by the word 'volition' in order to understand the import of the word 'will,' for this last word expresses the power of mind of which volition is the act. 'The word 'will,' however, is not always used in this its proper signification, but is frequently substituted for 'volition,' as when I say that my hand moves in obedience to my will. D. Stewart.

3. The determination or choice of one possessing authority; discretionary pleasure; behest; command; decree.

Thy will be done. Mat. vi. 10.

Go then, the guilty at thy will chastise. Pope.

4. Strong wish or inclination; bent of mind; disposition.

He that complains against his will, Is of the same opinion still. Hudibras.

Inclination is another word with which will is frequently confounded. Thus, when the apothecary says in Romeo and Juliet:

My poverty and not my will consents, &c. the word will is plainly used as synonymous with inclination, not in the strict logical sense, as the immediate antecedent of action. It is with the same latitude that the word is used in common conversation, when we speak of doing a thing, which duty prescribes, against one's own will; or when we speak of doing a thing willingly or unwillingly.

5. That which is strongly wished or desired. He holds him with his glittering eye,— The marriage-guest stood still And listens like a three-years' child, The mariner hath his will. Coleridge.

6. Absolute power to control, determine, or dispose; arbitrary disposal. Deliver me not over unto the will of mine enemies. Ps. xxvii. 12.

7. In law, the legal declaration of a man's intentions as to what he wills to be performed after his death in relation to his property; a testament. In England no will, whether of real or personal estate, is to be valid unless it be in writing, and signed at the foot or end by the testator, or by some person in his presence, and by his direction. Such signature must be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, and such witnesses must attest and subscribe the will in the presence of the testator. Soldiers on actual service, or of mariners at sea, have the power of making unexecuted wills. In the United States the law is in substantial agreement with that of England. In Scotland formerly only personal property could be disposed of by will, real property being conveyed by a disposition or deed in which the testator's liferent in the subject was reserved, but heritable property can now be so disposed of.—Good will, (a) favour; kindness. (b) Right intention. Phil. i. 15.—Ill will, enmity; unfriendliness. It expresses less than malice. See GOOD-WILL and ILL-WILL.—To have one's will, to obtain what is desired.—To work one's will, to act absolutely according to one's own will, wish, pleasure, or fancy; to do entirely what one pleases with something.

For though the Great Ages leave the hill And break the shore, and evermore Make and break and work their will, . . . Tennyson.

—At will, at pleasure. To hold an estate at the will of another is to enjoy the possession at his pleasure, and be liable to be ousted at any time by the lessor or proprietor. See under ESTATE.—With a will, with willingness and pleasure; with all one's heart; heartily.

He threw himself into the business with a will. Dickens.

Will (wil), v. aux., pres. I will, thou wilt, he will; past, would; no past participle. [A. Sax. wllan, pres. sing. 1 and 3 wile, 2 will, pl. wllath (1, 2, and 3); pret. woldæ, woldest; pl. woldon or woldan; D. wllen, Icel. vilja, Dan. ville, to will; G. will, I will, he will, infin. wollen; Goth. viljan; cog. L. volo, I will, velle, to will; Gr. boulomai, I will. Akin will, weat, wald.] A word denoting either simple futurity or futurity combined with volition according to the subject of the verb. Thus, in the first person, I (we) will, the word denotes willingness, consent, intention, or promise; and when emphasized it indicates determination or fixed purpose; as, I will go, if you please; I will go to all hazards; I will have it in spite of him. In the second and third persons will expresses only a simple future or certainty, the idea of volition, purpose, or wish being lost; thus, 'you will go,' or 'he will go,' indicates a future event only.

The second person may also be used as a polite command; as, you will be sure to do as I have told you.—As regards will in questions Mr. R. Grant White lays down the following rules. 'Will is never to be used as a question with the first person; as, will I go? A man cannot ask if he wills to do anything that he must know and only he knows. . . . As a question, will in the second person asks the intention of the person addressed; as, will you go to-morrow? That is, Do you mean to go to-morrow? . . . As a question, will in the third person asks what is to be the future action of the person spoken of, with a necessary reference to intention; as, will he go? that is, Is he going? Does he mean to go and is his going sure?' Simple futurity with the first person is appropriately expressed by shall. (See SHALL.) Among inaccurate speakers and writers, especially in Scotland, Ireland,

and in some parts of the United States, there is some confusion in the use of *shall* and *will*; thus *will* improperly takes the place of *shall* in such frequently used phrases as, 'I will be obliged to you,' 'we will be at a loss,' 'I will be much gratified,' and so on.—*Would* stands in the same relation to *will* that *should* does to *shall*. Thus *would* is seldom or never a preterite indicative pure and simple, being mainly employed in subjunctive, conditional, or optative senses, in the latter case having often the functions and force of an independent verb; as, (a) conditional or subjunctive, 'he would do it if he could,' 'he could do it if he would,' 'they would' have gone had they been permitted.' Here it will be seen *would* refers to the present only, the past being expressed by *would have*. In such sentences as 'He was mistaken it would seem,' or 'it would appear'—in which *should* is sometimes used—*would* retains almost nothing of conditionality, having merely the effect of softening a direct statement. (Mr. R. Grant White regards 'it should seem' as the normal expression, though he quotes 'it would appear' from good English writers. He himself writes, 'It would seem that a man of Mr. Lowe's general intelligence should know,' &c. *Every-day English*, chap. xiii.) (b) Optative; 'I would that I were young again.' In this use the personal pronoun is often omitted. 'Would to God we had died in Egypt.' Ex. xvi. 3. 'Would God I had died for thee, O Absalom.' 2 Sam. xvii. 3. 'Would thou wert as I am.' *Shak.*—*Would* most nearly has the force of a simple past indicative in such sentences as, 'he would go and you see what has happened,' but this implies farther that he did actually go or at least set out, and the *would* is here emphatic.—*Would* is also used to express a habit or custom, as if it implied a habitual exercise of will; as, she would weep all day; every other day she would fly into a passion.—*Will* and *would* were formerly often used with adverbs and prepositional phrases to express motion or change of place, where modern usage would require *will go, would go*, or the like. 'Now I will away,' 'I'll to the aie-house.' 'I will about it,' 'I'll to my books,' 'he is very sick and would to bed,' 'there were wit in this head, an'twoud out.' *Shak.*—What may be called a similar elliptical usage occurs in such phrases as 'what would you?' where present usage would supply *have* or *do*.

**Will** (wil), *v. t.* [From the noun rather than from the auxiliary verb. In this use the conjugation is regular, pres. ind. I *will*, thou *wiltest*, he *wills*, &c., pret. & pp. *willed*,] I. To determine by an act of choice; to form a distinct volition of; to ordain; to decree; to decide.

The common name of different species of plants belonging to the genus *Salix*, the type of the natural order Salicaceae. The species of willows are numerous, about 160 having been described, many of which are British. They are all either trees or bushes, occurring abundantly in all the cooler parts of the northern hemisphere. They grow naturally in a moist soil, and wherever planted they should be within the reach of water. On account of the flexible nature of their shoots, and the toughness of their woody fibre, willows have always been used as materials for baskets, hoops, crates, &c. The wood is soft, and is used for wooden shoes, pegs, and the like; it is also much employed in the manufacture of charcoal, and the bark of them all contains the tanning principle. The Huntington or white willow (*Salix alba*) and the Bedford willow (*S. Russelliana*) are large trees, yielding a light soft timber, valuable for resisting the influence of moisture or damp. The weeping willow (*S. babylonica*) is a native of China, and is a fine ornamental tree. The willow has for long been considered as symbolical of mourn-

ing, grief, bereavement, forsakenness, or the like.

**Wind** (wind, in poetry often *wind*), n. [A. Sax. *D*, and G. *wind*, Dan. and Sw. *vind*, Icel. *vindr*, Goth. *vinds*; cog. L. *ventus*, W. *grynt*, wind. The root is in Goth. *vaian*, Skr. *vâ*, to blow. *Weather* is from same root.] 1. Air naturally in motion with any degree of velocity; a current of air; a current in the atmosphere, as coming from a particular point. When the air moves moderately, it is called a light wind or a breeze; when with more velocity, a fresh breeze; and when with violence, a gale, storm, tempest, or hurricane. The principal cause of these currents of air is the disturbance of the equilibrium of the atmosphere by the unequal distribution of heat. When one part of the earth's surface is more heated than another, the heat is communicated to the air above that part, in consequence of which the air expands, becomes lighter, and rises up, while colder air rushes in to supply its place, and thus produces wind. As

the heat of the sun is greatest in the equatorial regions, the general tendency there is for the heavier columns of air to displace the lighter, and for the air at the earth's surface to move from the poles toward the equator. The only supply for the air thus constantly abstracted from the higher latitudes must be produced by a counter-current in the upper regions of the atmosphere, carrying back the air from the equator towards the poles. The quantity of air thus transported by these opposite currents is so nearly equal, that the average weight of the air, as indicated by the barometer, is the same in all places of the earth. Besides the unequal distribution of heat already mentioned, there are various other causes which give rise to currents of air in the atmosphere, such as the condensation of the aqueous vapours which are constantly rising from the surfaces of rivers and seas, and the agency of electricity. Winds have been divided into *fixed* or *constant*, as the trade-winds; *periodical*, as the monsoons; and *variable winds*, or such as blow at one time from one point, at another from another point, and at another time cease altogether. (See TRADE-WIND, MONSOON.) There are also various local winds, which receive particular names; as, the *Etesian wind*, the *Sirocco*, the *Simoom*, the *Harmattan*, the *Mistral*, *Typhoon*, &c. (See these terms.) The velocity and force of the wind vary considerably, as shown by the anemometer. Thus a light wind travelling at the rate of 5 miles an hour exercises a pressure of 2 oz. on the square foot; a light breeze of 10 miles an hour has a pressure of 8 oz.; a good steady breeze of 20 miles, 2 lbs.; a storm of 60 miles, 18 lbs.; a violent hurricane of 100 miles, 60 lbs., a pressure which sweeps everything before it. Winds are denominated from the point of compass from which they blow; as, a *north wind*, an *east wind*, a *south wind*, a *west wind*, a *south-west wind*, &c.

Except wind stands as it has never stood,  
It is an ill wind that turns none to good. *Tusser*.

[Slang.]—*To be in the wind*, originally perhaps literally to be such as may be scented, hence to be in covert preparation; to be within the region of suspicion or surmise, without being acknowledged or announced; as, I strongly suspect there is something in the wind which will shortly astonish us. [Colloq.]—*To carry the wind*, in the manage, to toss the nose as high as the ears, said of a horse.—*To get (take) wind*, to be divulged; to become public; to be disclosed; to become generally known; as, the story got (took) wind.—*To get one's wind*, to recover one's breath; as, they will up and at it again when they get their wind.
